

BASIC DIGITAL SAFETY

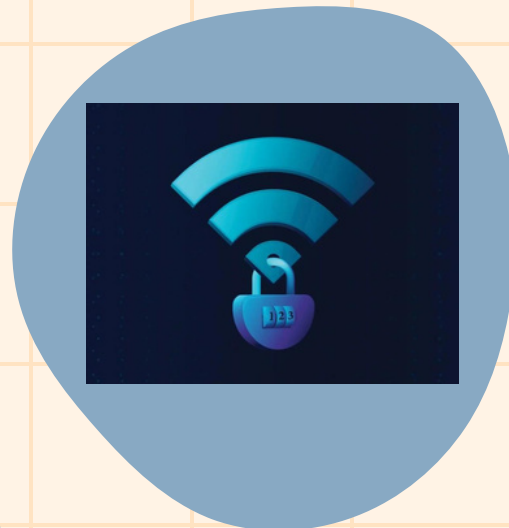

THINK BEFORE YOU CLICK

How do thieves typically obtain your personal information? It occurs when you click on something that isn't appropriate.

REPORT PHISHING

Reporting phishing efforts is one of the finest methods to take down cybercriminals, and it's easier than ever these days.

USE SECURE WI-FI

Since public wireless networks and hotspots lack security, anyone could be able to view everything you do on your smartphone or laptop while you're connected to them.

SHARE WITH CARE

Before publishing anything online about yourself or others, consider it. Think about what a post discloses, who might view it, and the potential consequences for you or others.

CREATE LONG, UNIQUE PASSWORDS

Quantity exceeds intricacy. Strong passwords consist of letters, numbers, and symbols and are at least 12 characters long.
