How we can make the world a better place by 2030

Watch the TED talk entitled 'how can we make the world a better place by 2030 by Michael Green. Green says that he believes the global goals are an historic opportunity – to what extent do you think it is possible for us to travel 'a different path' by 2030? Can we 'choose the world that we want'? As usual, leave your thoughts in the discussion forum provided.

Answer:

From my understanding from the Ted Talk by Michael Green, that we could sketch the structure of an index that could be used to measure the physical production of goods and services, affected positively or negatively by limitations linked to sustainability and the quality of life. One would have, therefore, a Social progress Index (SPI) that would be a direct function of an index structured on the basis of the existing statistical indicators of human development, improved in accordance with the sustainability studies of the and affected by parameters linked to a quantitative definition of sustainability, which would in turn be set by the entropic rankings of the products with greater weightings in the production of the economy, and brought together in the form of an Sustainability aspect.
