

The role of Children Care worker

Children Care worker is a job that requires careful planning and preparation, personal skills, and attributes. These include skills in communication, problem-solving and the ability to work with children. They need to have skills to organise and plan activities for children and to prepare and manage a play environment for them. Children are unique individuals, and you should be aware of how to work with a range of children with varying needs.

This includes understanding that children will have different dispositions with diverse ways of playing and learning and understanding what other support a child may need from time to time. Working with children is interesting and varied.

The role and knowledge of childcare workers in UK, at private day Nursery is to contribute to helping children to develop and to helping parents to know and understand their children and give support for the correct development because not all children are the same. Barratt-Pugh, pp. 1-25 (2001).

In this job the most important thing is to be patient, to understand what they need, to approach them depending on how much they understand. Some children have a more restless temperament, others very calm, others may have communication or adaptation problems in any situation you have to communicate differently. Barratt-Pugh, pp. 1-25 (2001)

The Health Research Services from United Kingdom have organized a study to identify the causes of infection risk among children in nurseries. The study confirmed that the children were sent to the nursery, although in the last 12 hours they were given paracetamol, following the presentation of some symptoms. Following this conclusion, the nurseries will be given the right to decide whether the child can participate in the day of the nursery or not, depending on the Child's condition.

Working with children also involves a great responsibility in maintaining hygiene standards. Once they are not properly observed, the consequences can lead to a

high risk of infections among children in the nursery. Carroll et al., pp. 161 - 168 (2020).

To reduce the risk contamination, the childcare worker has a responsibility to teach children to wash their hands and mouth to protect themselves. The bacteria are multiplying in every twenty minutes, neglect the hygiene, can bring various infections in the nursery. Parents also have the obligation to notify when the child shows certain contagious symptoms. so that the childcare worker can decide whether the child can participate in the daycare on that day. Carroll, F. E. et al. (2020), pp. 161–168.

The settings were diverse, an urban private day nursery with a courtyard outside space where appropriate materials were sourced from outside the setting for children to use, a rural private day nursery with its own woodland area and a childminder accessing a public woodland near her home. The research was based in England and therefore considered the Early Years Foundation Stage (EYFS) and in particular the principle 'enabling environments'.

The research concluded that successful outdoor play offers flexible opportunities where children engage in imaginative and creative play, develop their communication skills and build relationships with other children and adults.
