

Students visit a location related to topic of study (gallery, archaeological dig, factory etc.) and observe actual working processes.

Core Enhancing Technology

Key Technology Enhancements

- **Capture and sharing** — multimedia and data recorded on a field trip can be easily shared back in class using technology.
- **Access material remotely** — any files stored in cloud storage can be accessed on location provided there is an internet signal.
- **Inclusivity** — Connecting with students through Skype or recording video footage allows all students to take some part in the field trip even if they are unable to attend physically.

Teaching and Learning Ideas

- Students can freely capture video and audio footage of the field trip on their own devices in the knowledge that it can be easily shared for review, analysis and discussion on return to the classroom using Sony Vision Exchange or LanSchool.
- Students can work on pre-existing or new Office 365 files in real-time by accessing them through the cloud on mobile devices. Prepare a data table in class, then fill the data collected live on-site using the mobile device.
- Using Skype for Business through a mobile device can give an absent student a real-time view of the field trip site and allow them to make live contributions to the discussion. Alternatively, Panopto can be used to create a live stream of the visit for viewing by many.
- Field Trip video footage can be uploaded into Clickview and turned into an interactive video with questions and discussion prompts as a follow-up reflection on the visit.
- Use Yammer to maintain a whole-group conversation on field trips where different groups are required to be at different locations.

Try Also...

Today's Meet and Twitter are alternatives to Yammer for running an online group conversation. QR codes could be used to set up a digital treasure hunt at a field trip location.
