## **Section A**

2. The demand for care, treatment, change and improvement by natural resources has increased more and more, with the requirement to remain alert and thus be able to guarantee a sustainable management of these same natural resources as well as: water, air, nature in a whole. However, the law aims to allow these requirements to be met and to be conducted or governed in an integral, sustainable and proactive manner. Ensured that we have a legislative framework that will allow take go forward or manage and that it is recognized that all these natural resources are connected to our society, economy and the whole environment.

## **Section B**

4. Governance has a great impact on environmental conservation, in terms of management, control, on the economic side and political side, I speak of leadership, each government has its own way or way of leading and we, human beings, tend to listen, abide by, obey the rules and laws that are implemented in each country or restricted to those who are available to improve and preserve our environment and also protect the natural resources that are around us or that we are surrounded by. An example is the deforestation of the Amazon rainforest in Brazil, considered the largest tropical rainforest in the world, according to the news by the BBC news which was provided by the country's special agency (Inpe), on November 30 of 2020, the deforestation of the Amazon forest reached its highest level since 2008, having a tropical destruction from August 2019 to July 2020. The Amazon Forest is not only a national asset for the country but also for the world, and a carbon stock that slows down the pace of global warming. Now let's see, the Amazon Forest has suffered from deforestation for years, and the level of it has only been increasing since the current president, Jair Bolsonaro, took office in January 2019, as it has been encouraging agricultural and mining activities. If a leader who is supposed to set an example, encourage, help, support to protect our environment for the

benefit of everything and everyone, as the people around him will know of the importance that it means and represents, in everything that it exists in it and flourishes. Encouragement, paving a path for everyone to follow and learn, for those who do not know and do not value something that is beneficial for all of us and for our land.

## **Section C**

8. The development of EU Environmental Action Programs consists of focusing on the relevant challenges that we have faced the most in Europe, of which they were mentioned according to the 2010 Environmental Situation. Over 40 years of important achievements by the European Union, if so in a strategic way that they are crucial for the environment which includes the Communication for better provision of environmental advantages, the reduced carbon, Biodiversity methods for the year 2020. Although most members of the European Union face a difficulty economic in the year 2020, due to the Coronavirus Pandemic, many of them are striving for new possibilities and with a lot of effort to fulfil the Environmental policy action plans. From my understanding, the UK is counting on or relying on economic aid and also in terms of environmental research from other members of the European Union so, with Brexit it is possible that the UK will feel that impact unless an agreement is made for improvement such as in terms of air pollution, so the countries could work together and share knowledge.
