RESEARCH PROJECT PROPOSAL

**‘How can we convince travellers to choose rail travel as an
eco-friendly and responsible transportation option when
attending events?’**

World Count: 2025
Angelika Jasnos 2308967
Lecturer: Scott James

Introduction

Rail travel plays an important role in the Tourism and Events sector, especially when hosting large events. It offers several advantages that make it an essential mode of transport.

1

Firstly, rail travel is cost-effective and can accommodate large numbers of passengers, making it ideal for transporting attendees to major events. It is also eco-friendly, producing lower greenhouse gas emissions compared to cars. This sustainable aspect is important as destinations aim to reduce their environmental footprint.

Moreover, rail networks often connect directly to city centres and event venues, providing convenient access for tourists. This ease of access can enhance the overall experience, encouraging higher attendance and repeat visits. In terms of additional benefits, rail travel can stimulate local economies by increasing foot traffic in areas surrounding stations and event venues. (Dr Stainton, 2020)

To find out what people think about rail and how we can convince them to use rail travel as an eco-friendly option market research has been done.

For this work, a survey was conducted which in the first questions presents the profile of the respondent. Then questions help answer how we can convince people to use rail transport (Survey, 2024). The survey was carried out among people living in the Swansea area (Llanelli, Neath and Port Talbot).

2

Research methodology

Research design is a comprehensive plan or blueprint for conducting research, aimed at answering specific research questions, test hypotheses or get insights. It outlines the framework for data collection, measurement, and analysis, ensuring that the study is methodologically sound and relevant. Research design can be categorized broadly into quantitative, qualitative, or mixed methods (Karunarathna, 2024).

A key decision in research design is whether to use qualitative, quantitative, or mixed methods. Qualitative research is ideal for understanding complex phenomena and exploring subjective experiences, it is **Good!** numerical data. Whether quantitative research involves numerical data and statistical analyses to test hypotheses and assess relationships. Mixed methods research combines both techniques, offering a more comprehensive understanding (Tegan, 2023).

Data collection is a process of gathering information to address the research questions. The choice of data collection methods depends on the research design and the nature of the data required.

There are a few qualitative data collection methods. One of them is interview. One-to-one interview provides deep insight into participants' perceptions and **Good!** experience. Another one is observations. Researchers observe participants in natural settings to collect data on behaviour and interactions. This method helps gather real-world information (Hassan, 2024).

One of the quantitative data collection methods is secondary data where researchers use existing data sets to test new hypotheses. Another one is surveys/questionnaires. These are commonly used to collect data from a large sample. They can be administered online, face-to-face, or via telephone (Scheuren, 2004).

For this work, a survey was the best choice of research method. Events typically attract people from various backgrounds and locations. Using an online survey allows you to reach a broader audience, making it possible to capture the views of a large sample of eventgoers who may use different types of transport or have varying motivations.

Another reason to choose this method was that collecting data online is efficient, especially when targeting a specific group **Interesting!** event attendees. Surveys allow rapid data collection without the need for in-person interviews, making it easier to gather information from many people in a short period. (Fletcher and Bostock, 2019).

To determine how to encourage trial travel, it's important to gather quantitative data on attendees' preferences, perceived barriers, and motivations for using or not using alternative transport. Surveys are ideal for asking structured questions that yield quantifiable data, such as rating scales or multiple-choice questions. [Add citation](#)

Surveys provide data in a format that is easy to analyse, especially if the questions are close ended (e.g., yes/no questions). This is helpful when you need clear, actionable insights into what factors could increase trial travel uptake (Wong and Wan, 2012).

There are three types of research- explanatory, descriptive and predictive.

Explanatory research is used to investigate [Good!](#) that is not well understood. Often occurs when in area research needs to be done but there is not much available information.

Descriptive research involves observing and recording characteristics and behaviours. We describe what happened in the past without changing anything.  3

Predictive research is designed to anticipate future events or outcomes by analysing current or past data. It concentrates on utilizing existing information to make educated guesses about what is expected to occur in the future. (Bhat, 2019)

Sampling in research methods refers to the process of selecting a subset of individuals or items from a larger population to study and draw conclusions about that population. The goal of sampling is to make the research more manageable while still allowing for valid and generalizable results.

There are two main categories of sampling methods.

One of them is probability sampling, which involves random selection, giving each member of the population an equal chance of being chosen. It's used to create a sample that is representative of the entire population. [Add citation](#)

Simple random sampling means every member of the population has an equal chance of being selected.

Stratified sampling is when the population is divided into subgroups (strata) based on a specific characteristic (e.g., age or gender), and then random samples are taken from each subgroup.

Systematic Sampling happens while every nth individual is selected from a list of the population.

The last sampling selection is cluster sampling when the population is divided into clusters (often geographically), and entire clusters are randomly selected for the study. (Trochim, 2020)

For the survey has been used [Good!](#) sampling. Geographic targeting ensures that the survey results are applicable to the local area, addressing the research objectives effectively. The research market was focus on Swansea area, so this sampling was the best choice.

Second one is non-probability sampling. This does not involve random selection, meaning not everyone in the population has an equal chance of being included. It's often used when random sampling is impractical.

Convenience sampling is selecting individuals who are easiest to access, such as volunteers or people nearby. While purposive sampling selects participants based on specific characteristics or expertise related to the study.

Snowball sampling happens while existing study participants recruit additional participants from their network.  4

Quota sampling is when the researcher ensures that the sample reflects certain characteristics of the population in proportion (like gender or age), but participants are selected non-randomly. (Bryman, 2016).

Ethics is a fundamental aspect of research methodology, ensuring that the research is conducted responsibly and with respect for participants' rights and welfare. Ethical

considerations are crucial in maintaining the credibility of the research and safeguarding participants.

There are a few principles to follow. One of them is that participants must be fully informed about the research and voluntarily agree to participate. Researchers must protect the privacy of participants and keep their data confidential. Another one is ensuring that participants' identities are not linked to their data. Researches must also ensure that participants are not exposed to any harm, whether physical, psychological, or emotional. Researches must conduct their research with honesty and integrity, avoiding any form of misconduct or fraud. Participants should be informed about the study's purpose and findings after their participation. Participants should know they can withdraw at any time without facing any negative consequences. (Resnik,2020)  5

Significance of the study

Every study aims to fill a gap in the current body of knowledge, often addressing unanswered questions or resolving uncertainties within the field. This research's significance lies in its ability to provide novel insights or extend understanding in specific areas that may have been underexplored (Hassan,2024).

This research is essential because it addresses a growing need to reduce environmental impacts from mass travel at events. By  Interesting!  6 the factors that influence people's decisions to try alternative travel options, the study fills a knowledge gap, especially in understanding motivations and barriers in a real-world context.

This study also contributes valuable insights into the motivations and barriers associated with trial travel. By focusing on the psychology of event attendees, it provides a framework for future researchers to explore similar topics across other events and demographic groups. Additionally, the findings can deepen our understanding of sustainable travel behaviour, enhancing theories in environmental psychology and behavioural economics (Cerezo-Esteve, 2022)  7

The practical implications of this research are significant. By identifying which factors make people more likely to try alternative transport, event organizers and policymakers can design strategies that encourage sustainable travel. These insights may also influence transportation planning for large events, potentially inspiring policies that support eco-friendly transit options, such as subsidized ticketing or integrated public transport routes for attendees.  8

The survey that was conducted aimed to understand the motivations, perceptions, and potential incentives that could encourage travellers to choose rail as an eco-friendly option when attending events. Most respondents attended events between one to a few times a year, with cars being the most common modes of transport. Cost, comfort and travel time emerged as the top factors influencing travel choice, while the main barriers to rail travel included ticket prices and limited schedule flexibility. Over 70% of respondents stated they would consider rail if they knew it was more eco-friendly than other options. However, many still associate rails travel with being  Good!  and less convenient. Discounted rail tickets and partnership with event's organizers for seamless travel planning were rated as the most appealing incentives, with over 70% of respondents stating that they would be more likely to choose rail travel if it was directly integrated with event tickets. To promote rail as a preferred mode for eco-conscious event travel, offering bundled event-rail tickets, showcasing environmental benefits, and improved convenience and scheduling could be effective strategies. (Survey,2024)

Timeline and budget

A timeline for a research project is a structured plan that outlines the stages of the study and when each should be completed.

First start with a literature review (reading existing research) to understand what's been done on your topic and to define your own research questions. Set up the methods and tools you'll use to collect data and test them to ensure they work. This should be done in week 1-2.

Milestone: Approval of survey content and testing completed. In week 3-5 data collection. Distribute the online survey via email, social media, and relevant networks. Mileston: Survey closes after reaching the target sample size. Next step (week 6-7) is to analyse the gathered data to find patterns, answers, or insights related to research questions. Analyse responses using statistical software, ensuring reliability and validity of the findings. Milestone: Completion of initial data interpretation. Final step is preparation a comprehensive report summarizing findings and recommendations. This should be done in week 8. Milestone: Submission of the final report.

A budget helps estimate the costs associated with the research. It usually includes personnel (costs for anyone helping with project), materials (e.g. software for data analysis, printing surveys) and travel if you need to travel for interviews.

Conclusion

Conducting the survey has its advantages and disadvantages. One of the advantages is that survey can reach participants quickly as it is distributed online. Compared to interviews or focus groups, surveys are generally less expensive, as they reduce the need for travel, materials, or interviewer costs. Surveys provide a consistent set of questions to all participants, which reduces variability in responses and allows for easier comparison and analysis of data. Surveys often yield quantitative data that can be easily analysed using statistical methods, making it possible to identify patterns, correlations, or trends within the data. Online or anonymous surveys may make participants more comfortable, especially for sensitive topics, resulting in more honest and reliable responses (Wright,2005).

However, surveys generally provide s **Good!** -level information and may lack the depth of understanding that qualitative methods (like interviews) provide. Responses are usually restricted to the options given in the survey. Respondents may not always answer honestly or may select answers they believe are more socially acceptable, introducing bias that skews results. Surveys, especially online, often have lower response rates, which can affect the representativeness of the sample and reduce the generalizability of the findings. Participants might misunderstand survey questions, particularly if the wording is unclear, leading to inaccurate responses that impact data reliability (Thomas, 2024).

GRADEMARK REPORT

FINAL GRADE

GENERAL COMMENTS

SJ

56/100

Thank you for your submission.

For further feedback, please refer to the 'Rubric/Form' tab below.

PAGE 1

PAGE 2

Comment 1

In future, ensure to justify your work (Ctrl J) and to have 1.5 line spacing. Please reach out to me (Scott) if support here is needed.

Comment 2

Your introduction effectively highlights rail travel as a key factor in hosting large events, focusing on its accessibility, efficiency, and environmental benefits. The point about how rail travel helps move large crowds easily is really important and ties in well with the broader topic. It's a smart move to suggest including background information on the sector and specific events, as this adds valuable context to your argument. You also do a great job of pointing out the extra benefits rail travel brings to a destination, like boosting the local economy, reducing traffic, and enhancing the overall visitor experience. This really strengthens your argument and provides a well-rounded view of the subject.

Good!

Good!

Comment 3

Which type of research would be best suited for your research? This needs to be applied.

Add citation

Add citation

Good!

Comment 4

It is good that you have highlighted the different types of sampling methods. However, you need to be more critical. Why have you chosen that particular sampling method? Why is it beneficial for your research? Try and not fall into the trap of describing.

Good!

Comment 5

Ethical concerns are clearly addressed, with a focus on protecting participants' rights and maintaining the integrity of the data. This section covers key ethical aspects such as informed consent, confidentiality, anonymity, and managing any potential risks to participants.

Comment 6

The importance of the research is mentioned, but the explanation feels a bit lacking. While it highlights the relevance of the study, it doesn't fully explain why this research is needed or how it addresses gaps in existing knowledge. Expanding on the broader context and significance of the research would provide a clearer understanding of why it matters.

Interesting!

Comment 7

The potential contributions are mentioned, but they're not fully explored. It gives a general sense of how the research could benefit the field, but the explanation lacks detail. Including

more specific examples of how the research could advance knowledge or improve practices would make this section more engaging.

Comment 8

The practical implications are mentioned, but the discussion feels a bit vague. While it notes that the findings could be applied in real-world settings, it doesn't provide details on how they might actually influence practices or decision-making. Including a few examples of where or how the findings could be used would make this section stronger.

Good!

PAGE 5

Comment 9

It is good that you have in mind a timeline of what you want to achieve and when by. However, to make this section stand out, it would be good if you were able to present this into a table or Gantt Chart. This would give the reader a visual of what is to come. Also, as this is a research proposal which will be used to support Assignment 2, some of your dates will not work. Just keep that in mind.

Comment 10

Your budget needs to be relate back to your research. For example, you mentioned in your introduction that you are going to be using surveys. To create the surveys, will this be done online via paid tools? Also, to get across South Wales, will you be using train, car or bus? Fairs need to be included in the budget.

Good!

PAGE 7

GRADING FORM: RESEARCH METHODS ASSIGNMENT 1

ANGELIKA JASNOS

56

ENGAGEMENT WITH LITERATURE

You should incorporate academic material about research methodology in section 2, while sections 1 and 3 will utilise online sources mainly to provide underpinning material for your case study. Be respectful for other who have produced work and cite their work. Show academic honesty and credibility. Your academic sources for methodology should be from text books and academic journals. Go beyond what is provided to you in the module for better marks. All sources must be critically evaluated – so that if you are using a weak source, you show it has some limitations. You must include a minimum of 20 reference sources, with in-text citations.

Engagement with an appropriate range of literature, including sources retrieved independently. Some over-reliance on texts. Referencing may show minor inaccuracies or inconsistencies.

12

KNOWLEDGE AND UNDERSTANDING

You should show an understanding of research methods and how these can be used to investigate case study organisations in Travel and Tourism. You should show some knowledge of analytical approaches suitable to the field and show where there are limitations. This assignment should also be supported by your understanding of the field generally and all modules that you will have studied up to this point.

Limited but adequate knowledge and critical understanding of the well-established concepts and principles within the subject area, with a few gaps in the selection of material. A narrow critical understanding of the main methods of enquiry.

9

COGNITIVE AND INTELLECTUAL

You should be able to show an appreciation for which research methods are appropriate for your case study investigation. These should be well thought out, and relatively achievable, although there is always room for some failure within a plan/scheme. You should show a coherent understanding of how all the information fits together to produce your case study. You will get better marks for demonstrating the academic underpinnings of your methods and techniques.

Some critical evaluation and analysis of concepts and principles, though descriptive in parts.
An emerging awareness the limits of their knowledge and ability to use evidence to support the argument though with some tendency to assert/state opinion rather than argue on the basis of reason and evidence.
Mostly valid arguments and logical judgements.

16

PRACTICAL SKILLS

You need to focus on selecting appropriate methods for the case study to produce meaningful and interesting findings- these need to be realistic and practically achievable given the context and limitations. You will get better marks for using the appropriate academic language, terminology and concepts. You should use what you have learned from modules up until now to assist you in writing this case study project.

A good and appropriate application of established methods, materials, tools and/or techniques.
Clear appreciation of the context of the application. Mainly consistent, accurate and logical application of theory to practice, making appropriate links between the two.
Can identify problems and propose mostly

11

appropriate solutions outside the context in which they were first studied.

TRANSFERRABLE SKILLS

The project should be structured in accordance with an academic report layout using the structure provided. This should involve headings, subheadings and captions that describe any diagrams or pictures. The content should be of a professional standard with correct spelling, grammar and a logical flow to your discussion. The work needs to be supported with citations which should be referenced using the Harvard method. Arial font 12 should be used, with 1.5 line spacing and justified text.

Can communicate in a suitable medium for the audience but with some room for improvement. Mostly ordered presentation and structure in which relevant ideas / concepts are reasonably expressed. Work may lack coherence in places. Can work as part of a group, meeting most obligations to others but perhaps with limited involvement in group activities. Demonstrates the basic skills for employment requiring the exercise of personal responsibility and decision-making, with some areas of minor weakness.

8
