

Name: Duke Donald Asamoah

Student number: 1706143

Module name: Automotive ~~engineering~~ materials and sustainability

Module number: (ACHA6012)

13th / 05 / 2022

Section A

1. a) Ans = The two types of fuels that could be used are:

- Bio-fuels
- electric fuels

Bio-fuel help reduce greenhouse gases which are methane, carbon dioxide and nitrous oxide. By emitting less pollution. They are made from renewable resources and by growing more plants, they increase more oxygen and they decrease carbon dioxide. This cuts CO₂ emissions which is in line ~~with~~ with european parliament and council. That's 2019 setting CO₂ emission standards.

electric power cars needs a cleaner environment, They emit ~~fuel~~ greenhouse gases and air pollutants than Petrol or diesel cars.

The next euro standards framework (euro 7) is likely to be introduced in 2025. It is thought that the eu ~~committee~~ commission will ~~ban~~ banned combustion car engine production or that the exhaust emission limit will be too strict and that combustion engine manufacturer will not be competitive.
