

Using PebblePad with an iPad

About this Tipsheet

Whilst iPads do not support Flash and therefore you cannot access the main PebblePad system, you can still use many features via iPads and other mobile devices.

Asset Creation

You can use the mobile version of PebblePad to create assets without using the standard PebblePad interface. To log into the mobile version of your PebblePad install navigate to *your_install_URL/mobile*.

For example, <http://www.pebblepad.co.uk/personal/mobile/> will take you to the mobile version of PebblePad Personal. From here you can create most of the standard asset types such as action plans, abilities and forms.

You can also view and edit assets you have previously created or view gateways you are a member of.

Assets on Gateways

If you click on the Gateway option in the view section you will be presented with a list of the gateways you are a member of.

After selecting a Gateway you will receive a message that tells you that you are leaving the mobile site and whether you wish to continue. This appears because Gateways are fairly large in size and require a larger screen than the mobile site. So whilst they work well on a tablet such as an iPad they are not suitable for use on a mobile phone.

Once you confirm that you wish to continue you will see a view of the Gateway which is the same as the standard view you would see using a standard computer.

When you open an item it will open in a new, allowing you to view and provide feedback using the usual Gateway options.

For information about the PebblePad iPhone app please visit <http://www.pebblepad.co.uk/iphone.asp>.
