MODULE NAME AND CODE:ACADEMIC SKILLS LCBB4006

LECTURER'S NAME:ELLIE RISTIC

ASSIGNMENT TITLE:

THE IMPORTANCE OF RESEARCH AND REFERENCING

SKILLS FOR STUDENTS

## INTRODUCTION

Research skills and reliable reference are the main steps of academic and intellectual Main body

5 research that play an important role in the value completeness, and veracity of the work performed. Today there is a lot of information, but not always real. Possessing broad research skills enables the student to sweep through knowledge, arduously analyze sources and data, and summarize information directly and effectively. Furthermore, an acclaimed reference recognizes the contributions of others and protects against plagiarism. These activities contribute to the improvement of knowledge and maintain the critical idea. This work searches for the meaning in the research capacity and references in a purely academic and intellectual context leading to highlight the role of creation in imposing itself in a very strict method in the creation of truthfulness and in facilitating the improvement of innovation and progress

## MAIN BODY

The importance of the research and referencing about scholastic and academic assignments is fundamental because a source is taken from some specific books, written by someone who studies a particular argument in the material of study.

The reference is the proof that what is written is trusted and clear to understand,

It is possible to find the information we are looking for related to a particular topic from books, online sites, or even newspapers. the importance of research consists in finding topics related (Saunders and lewis,2023).

to the success of the research on the topic covered. so the student can improve his practicality in the use of finding sources from reliable sites or acclaimed authors ensuring that what has been reported is realistic and truthful. Very important in the context of the research of the topic covered is the relevance of the search, the topic must be connected to the search found. In this way, the student can start drawing personal conclusions based on real information by looking at the topic and based on real things.

Another key improvement that comes from research on information and developing a personal judgment, concerning the subject that the student is studying without being influenced by external judgments. Sometimes the search for elements requires additional effort by subjecting, the student to more in-depth and detailed, research this process allows the person to become more meticulous and professional this research helps you to become more creative and have a more open view is decisive about the information to choose about it.

The importance of an accredited reference is a fundamental factor in the development of the research of a topic, the reliability of an information resource supported by a reliable source creates respect and success in the eyes of the professors, about the exam that is taken

Place according to the same source

Plagiarism must be avoided because it constitutes a crime in the eyes of the university, plagiarism is identified in citing sources written by someone without acknowledgement

(Carroll,2009).

Without any merit, therefore the merit of a citation goes exposed by quoting the name of the author and where the certain quote is. A student who has good research skills will always have a truthful view supported by data and dates. by conducting a professional study

students can learn about quotes and references that enhance their perspectives and make their work more professional and relevant. Discovery skills are important for introducing new systems and criteria. By doing meticulous research, the student can improve those weak areas and bring their work to a higher level of professionalism, and it is also possible to make experiments or develop new assumptions related to testing a certain topic to bring innovations and improvements. in this way, solving problems also become much easier, because the student follows a systematic and methodological path researching. data and analyzing new aspects of data also helps the student to tackle difficult problems using evidence. these experiences can be adapted to new scenarios and contexts in which practicality is fundamental and coherence require commitment and study time. Paraphrasing consists of exposing someone else words and

(Carroll,2009)

trying to grasp the most correct form to summarize a certain concept allows the student to assimilate knowledge and work avoiding plagiarism by doing so students show original research competence and show their understanding that aligns with one's study goals. paraphrasing improves understanding of text citations referring to resources that have been elaborated upon and paraphrased about a particular research source providing small information such as author name and year of publication while managing to give a reference in the list or the bibliography. Text

citations can make various contributions: by giving credit to the real author and the respective authors, references are detailed lists of the provenance of a source, and they provide students with the information to find and verify the sources.

References are structured by entering the writer's name, the title of the research source, the publication date, or the page numbers used for that particular reference. the citation style that can be used can be APA, MLA, CHICAGO, OR HARVARD. To determine the format and order of these elements different academic institutions have their preferred citation styles therefore an examination should be performed following the guide that the academy requires with the specific standard. Citations should be included in the main text or an outline shown at the end of the document (Ranjit, 2019).

In addition, the reference provides the regularity of the law and copyright regulations of a given source, reporting the real origin of the students fall under the intellectual property rights of others. The reference gives a balance to the diffusion of knowledge and the protection of the merits of the original inventors.

According to the same source, collaboration provides a crucial in research, dialogue between the respective researchers and the exchange of supporting elements based on already existing research builds an advantage to improve and progress in certain aspects. It

helps intellectual debate and builds strong sharing in the academic community. Moreover, collaborative work can allow students to discuss certain topics and have greater support in the field of scientific research. Each student can bring a different predisposition to the study method they apply, sharing new ways of carrying out or finding the information that they research and by doing so there is an overall improvement within the group that takes part in this collaboration

### CONCLUSION

In conclusion, the importance of research and referring to a particular source is essential in academic and work fields, and also ranges in different contexts, in making decisions for example, in the acquisition in solving problems, or in the acquisition which is based on the evidence of the facts treated. It also increases the responsibility for the overall improvement of these referral management techniques are a major factor in personal and professional improvement and remarkable advancement in the world around us
