

2.0 Academic Writing

It is difficult to provide a precise description of scientific writing; however, in general, the purpose of such writing is to contribute new information to a conversation that is already taking place. The vast majority of the writing completed for academic purposes takes the form of articles, research papers, academic publications, and other forms of writing that are very comparable to these. The process of writing in this manner requires careful planning and organisation before beginning. In order to be successful in scholastic writing, you need to have a solid foundation. Not only does outlining make it simpler for the author to figure out what it is they want to say, but it also demonstrates to the reader how the various concepts are connected to one another. Additionally, academic writing needs to have the appropriate tone, which means that you can't use vernacular, abbreviations, or too many clichés in your writing. Since this is the case, the terminology that is utilised in academic writing needs to be precise and carefully selected. (Scispace (2022) Because the purpose of an essay or report is to educate facts rather than viewpoints, point of view is also typically written in the third person because writing in the third person is more impartial. Scholarly writing ought to have a distinct objective, a straightforward manner, and an authoritative tone. To further ensure that the viewer understands the argument being made, it ought to be backed up by evidence. There are five primary approaches to writing that you can take: writing artistically, relating a narrative, summarising something, attempting to persuade someone else, or clarifying something.
