MODULES	2

INTRODUCTION

This Module Directory includes all the modules for Level 4 within the Academic Discipline of Architecture, Construction and the Environment (WISA) in the academic year 2024-2025.

This directory accompanies the Programme of Study Handbook, which will provide you with details of which modules you will be studying for your programme this year in the 'Programme of Study' section. This directory may include modules that are running on other programmes of study within your Academic Discipline/Institute. If you require assistance in identifying the modules for your programme of study, please contact the Programme Manager (whose name and contact details are provided in the accompanying Programme of Study Handbook), or the relevant Institute Office.

The University has made every effort to make the information as full and as accurate as possible, but you should note that minor changes in the organisation of modules between the planning stage and the actual teaching are inevitable. We shall try to keep any such changes to a minimum, and you will receive plenty of advance warning in the event of any alteration. We would also be grateful if you would let us know about any changes that you think might be helpful if introduced into future handbooks.

MODULES

Module Code	ACAA5000
Title	Architecture Studio 2A
Date	13/07/2024
Level	5
Credits	20
Pre-Requisites	None

ARB*/RIBA criteria addressed in this module - * Due to national level changes, ARB prescription of Part 1 (BSc Architecture) will end on December 31st 2027. However, the programme will continue to map to the ARB criteria.	
Ability to create architectural designs that satisfy both aesthetic and technical requirements	GC1
prepare and present building design projects of diverse scale, complexity, and type in a variety of contexts, using a range of media, and in response to a brief;	1.1
understand the constructional and structural systems, the environmental strategies and the regulatory requirements that apply to the design and construction of a comprehensive design project	1.2
develop a conceptual and critical approach to architectural design that integrates and satisfies the aesthetic aspects of a building and the technical requirements of its construction and the needs of the user	1.3
Adequate knowledge of the histories and theories of architecture and the related arts, technologies and human sciences.	GC2
the application of appropriate theoretical concepts to studio design projects, demonstrating a reflective and critical approach.	2.3
Knowledge of the fine arts as an influence on the quality of architectural design.	GC3
the creative application of the fine arts and their relevance and impact on architecture;	3.2
the creative application of such work to studio design projects, in terms of their conceptualisation and representation.	3.3
Understanding of the relationship between people and buildings, and between buildings and their environment, and the need to relate buildings and the spaces between them to human needs and scale.	GC5
the needs and aspirations of building users;	5.1
the impact of buildings on the environment, and the precepts of sustainable design;	5.2
the way in which buildings fit into their local context.	5.3
Understanding of the profession of architecture and the role of the architect in society, in particular in preparing briefs that take account of social factors.	GC6
the potential impact of building projects on existing and proposed communities.	6.3
Understanding of the methods of investigation and preparation of the brief for a design project.	GC7
the need to critically review precedents relevant to the function, organisation and technological strategy of design proposals;	7.1
the need to appraise and prepare building briefs of diverse scales and types, to define client and user requirements and their appropriateness to site and context;	7.2
Understanding of the structural design, constructional and engineering problems associated with building design.	GC8
the investigation, critical appraisal and selection of alternative structural, constructional and material systems relevant to architectural design;	8.1
strategies for building construction, and ability to integrate knowledge of structural principles and construction techniques;	8.2
the physical properties and characteristics of building materials, components and systems, and the environmental impact of specification choices.	8.3

Adequate knowledge of physical problems and technologies and the function of buildings so as to provide them with internal conditions of comfort and protection against the climate.	GC9
principles associated with designing optimum visual, thermal and acoustic environments;	9.1
systems for environmental comfort realised within relevant precepts of sustainable design;	9.2
strategies for building services, and ability to integrate these in a design project.	9.3
The necessary design skills to meet building users' requirements within the constraints imposed by cost factors and building regulations.	GC10
prepare designs that will meet building users' requirements and comply with UK legislation, appropriate performance standards and health and safety requirements.	10.3
RIBA THEMES AND VALUES AT PART ONE LEVEL	T&V
Health and Life Safety: Demonstrating authoritative knowledge of statutory frameworks to safeguard the community and the end user.	1
Structures, Construction, and Resources: demonstrating climate literacy, responsible specification, and ethical sourcing to enhance wellbeing, minimise embodied carbon, waste, and pollution, and reduce demands on energy and water.	3
Design pedagogies and architectural expression: critically evaluating authentic aesthetic, compositional, and spatial principles to synthesise socially, ecologically, and environmentally sustainable integrated studio projects.	5
GRADUATE ATTRIBUTES AT PART ONE LEVEL	GA
ability to generate design proposals using understanding of a body of knowledge, some at the current boundaries of professional practice and the academic discipline of architecture;	1
ability to apply a range of communication methods and media to present design proposals clearly and effectively;	2
ability to identify individual learning needs and understand the personal responsibility required for further professional education.	6

AIM(S)

- To develop, building on the foundations laid in the first year design modules, the student's architectural design and representation skills through a series of design projects for small and medium sized domestic and community buildings and associated external spaces in defined existing contexts
- To develop the student's ability to apply technical knowledge (of building structure, construction and environmental impact) to create integrated designs that meet user needs and acknowledge physical and contextual constraints.
- To develop the student's understanding the character, quality and performance of buildings through the analysis of precedent

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Create well-resolved designs for groups of dwellings and/or small to medium size non-domestic buildings.
- Demonstrate understanding of the principles of dwelling design, responding creatively to the constraints of topography, built context, orientation and accessibility.

- Apply knowledge of structure, construction and environmental control technologies in the design of buildings of two or three storeys
- Use a variety of manual and computer depiction techniques to describe and explain architectural intentions
- Apply the techniques of the fine arts in the conception and depiction of design ideas.

INDICATIVE CONTENT

- Contextual study requiring the analysis of topography, built, form climatic influences etc
- Measured survey of an existing building presented in drawings and/or a digital model
- Design for the adaptive re-use of an existing building
- Design of a small group dwellings on a real site with clear contextual constraints
- Design of a small to medium size non domestic building in a real setting based on a clearly defined brief

LEARNING AND TEACHING STRATEGY

In this module students build on the design skills acquired in the first year architecture studio modules. The focus is on the design of domestic and small multi-use buildings in real settings and may involve the adaption of existing structures. It is taught in the first semester and leads directly into ACAA5001 Architecture Studio 2B. In a varied sequence of projects students apply observational and analytical methods to further develop their design thinking. Students respond (usually individually but sometimes in groups) to a brief or proposition. Ideas are developed using a variety of graphic and computer-based methods supported by discussion with tutors, fellow students and others. Proposals are presented using drawings, sketchbooks, physical models and digital images, often accompanied by explanatory text.

Scheduled learning: Regular studio sessions include: group project briefings, studio lectures, workshops, site visits, group tutorial sessions (or meetings with tutors off campus if delivered in the summer in block mode). Formative feedback is continuous in tutorial session and reviews in which students present their work to fellow students, tutors and sometimes visitors.

Independent learning. Between scheduled studio sessions students work independently both individually and collaboratively to develop their design ideas, carry out project related research and read relevant texts.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Structured Learning	12	6%
Independent learning	140	70%
Placement learning		
TOTAL	200	100%

ASSESSMENT

strategies for building construction, and ability to integrate knowledge of structural principles and construction techniques;	8.2
the physical properties and characteristics of building materials, components and systems, and the environmental impact of specification choices.	8.3

Adequate knowledge of physical problems and technologies and the function of buildings so as to provide them with internal conditions of comfort and protection against the climate.	GC9
principles associated with designing optimum visual, thermal and acoustic environments;	9.1
systems for environmental comfort realised within relevant precepts of sustainable design;	9.2
strategies for building services, and ability to integrate these in a design project.	9.3
The necessary design skills to meet building users' requirements within the constraints imposed by cost factors and building regulations.	GC10
prepare designs that will meet building users' requirements and comply with UK legislation, appropriate performance standards and health and safety requirements.	10.3
RIBA THEMES AND VALUES AT PART ONE LEVEL	T&V
Health and Life Safety: Demonstrating authoritative knowledge of statutory frameworks to safeguard the community and the end user.	1
Structures, Construction, and Resources: demonstrating climate literacy, responsible specification, and ethical sourcing to enhance wellbeing, minimise embodied carbon, waste, and pollution, and reduce demands on energy and water.	3
Design pedagogies and architectural expression: critically evaluating authentic aesthetic, compositional, and spatial principles to synthesise socially, ecologically, and environmentally sustainable integrated studio projects.	5
GRADUATE ATTRIBUTES AT PART ONE LEVEL	GA
ability to generate design proposals using understanding of a body of knowledge, some at the current boundaries of professional practice and the academic discipline of architecture;	1
ability to apply a range of communication methods and media to present design proposals clearly and effectively;	2
understanding of the alternative materials, processes and techniques that apply to architectural design and building construction	3

AIM(S)

- To develop, building on the foundations laid in the first year design modules, the student's architectural design and representation skills through a series of design projects for small and medium sized domestic and community buildings and associated external spaces in defined existing contexts
- To develop the student's ability to apply technical knowledge (of building structure, construction and environmental impact) to create integrated designs that meet user needs and acknowledge physical and contextual constraints.
- To develop the student's understanding the character, quality and performance of buildings through the analysis of precedent

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Design a small non-domestic mixed-use building, developed in significant detail and providing a creative response its physical and cultural context
- Use a variety of manual and computer depiction techniques informed by the traditions and contemporary practice of the fine arts to describe and explain architectural intentions

- Integrate knowledge of structure, construction and environmental control measures into the design of a multi-use building of two or three storeys
- Explain in detail the rationale for the disposition spaces with a building, its relation to its context and the choice of structure, construction and environmental control measures.

INDICATIVE CONTENT

- Contextual study requiring the analysis of topography, built, form climatic influences etc
- Measured survey of an existing building presented in drawings and/or a digital model
- Design for the adaptive re-use of an existing building
- Design of a small group dwellings on a real site with clear contextual constraints
- Design of a small to medium size non domestic building in a real setting based on a clearly defined brief

LEARNING AND TEACHING STRATEGY

This is the first of two second year second semester modules (ACAA5001 Architecture Studio 2B and ACAA5002 Architecture Studio 2C) which together offer an integrated sequence of design projects and share the same learning outcomes. Students build on the design skills acquired in the first year architecture studio modules and ACAA5000 Architecture Studio 2A which runs in the first semester. The focus is on the design of domestic and small multi-use buildings in real settings and may involve the adaption of existing structures and culminates (in ACAA5002 Architecture Studio 2C) in the detailed technical resolution of the design of a small multi-use building or group of buildings. In a varied sequence of projects students apply observational and analytical methods to further develop their design thinking.

Students respond (usually individually but sometimes in groups) to a brief or proposition. Ideas are developed using a variety of graphic and computer-based methods supported by discussion with tutors, fellow students and others. Proposals are presented using drawings, sketchbooks, physical models and digital images, often accompanied by explanatory text.

Scheduled learning

Regular studio sessions include: group project briefings, studio lectures, workshops, site visits, group tutorial sessions (or meetings with tutors off campus if delivered in the summer in block mode). Formative feedback is continuous in tutorial session and reviews in which students present their work to fellow students, tutors and sometimes visitors.

Independent learning

Between scheduled studio sessions students work independently both individually and collaboratively to develop their design ideas, carry out project-related research and read relevant texts.

AIM(S)

- To develop, building on the foundations laid in the first year design modules, the student's architectural design and representation skills through a series of design projects for small and medium sized domestic and community buildings and associated external spaces in defined existing contexts
- To develop the student's ability to apply technical knowledge (of building structure, construction and environmental impact) to create integrated designs that meet user needs and acknowledge physical and contextual constraints.
- To develop the student's understanding the character, quality and performance of buildings through the analysis of precedent

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Design a small non-domestic mixed-use building, developed in significant detail and providing a creative response its physical and cultural context

- Use a variety of manual and computer depiction techniques, informed by the traditions and contemporary practice of the fine arts to describe and explain architectural intentions
- Integrate knowledge of structure, construction and environmental control measures into the design of a multi-use building of two or three storeys
- Explain in detail the rationale for the disposition spaces with a building, its relation to its context and the choice of structure, construction and environmental control measures.

INDICATIVE CONTENT

- Contextual study requiring the analysis of topography, built, form climatic influences etc
- Measured survey of an existing building presented in drawings and/or a digital model
- Design for the adaptive re-use of an existing building
- Design of a small group dwellings on a real site with clear contextual constraints
- Design of a small to medium size non domestic building in a real setting based on a clearly defined brief

LEARNING AND TEACHING STRATEGY

Students build on the design skills acquired in the first year architecture studio modules and ACAA5000 Architecture Studio 2A which runs in the first semester. The focus is on the design of domestic and small multi-use buildings in real settings and may involve the adaption of existing structures and culminates (in ACAA5002 Architecture Studio 2C) in the detailed technical resolution of the design of a small multi-use building or group of buildings. In a varied sequence of projects students apply observational and analytical methods to further develop their design thinking. In a varied sequence of projects students apply observational and analytical methods to further develop their design thinking. Students respond (usually individually but sometimes in groups) to a brief or proposition. Ideas are developed using a variety of graphic and computer-based methods supported by discussion with tutors, fellow students and others. Proposals are presented using drawings, sketchbooks, physical models and digital images, often accompanied by explanatory text.

Scheduled learning: Regular studio sessions include: group project briefings, studio lectures, workshops, site visits, group tutorial sessions (or meetings with tutors off campus if delivered in the summer in block mode). Formative feedback is continuous in tutorial session and reviews in which students present their work to fellow students, tutors and sometimes visitors.

Independent learning. Between scheduled studio sessions students work independently both individually and collaboratively to develop their design ideas, carry out project related research and read relevant texts.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Structured Learning	12	6%

Module Code	ACAA5003
Title	History and Theory 2
Date	13/07/2024
Level	5
Credits	20
Pre-Requisites	None

ARB*/RIBA criteria addressed in this module - * Due to national level changes, ARB prescription of Part 1 (BSc Architecture) will end on December 31st 2027. However, the programme will continue to map to the ARB criteria.	
Ability to create architectural designs that satisfy both aesthetic and technical requirements	GC1
develop a conceptual and critical approach to architectural design that integrates and satisfies the aesthetic aspects of a building and the technical requirements of its construction and the needs of the user	1.3
Adequate knowledge of the histories and theories of architecture and the related arts, technologies and human sciences.	GC2
the cultural, social and intellectual histories, theories and technologies that influence the design of buildings;	2.1
the influence of history and theory on the spatial, social, and technological aspects of architecture;	2.2
the application of appropriate theoretical concepts to studio design projects, demonstrating a reflective and critical approach.	2.3
Knowledge of the fine arts as an influence on the quality of architectural design.	GC3
how the theories, practices and technologies of the arts influence architectural design;	3.1
the creative application of the fine arts and their relevance and impact on architecture;	3.2
Adequate knowledge of urban design, planning and the skills involved in the planning process.	GC4
theories of urban design and the planning of communities;	4.1
the influence of the design and development of cities, past and present on the contemporary built environment;	4.2
Understanding of the relationship between people and buildings, and between buildings and their environment, and the need to relate buildings and the spaces between them to human needs and scale.	GC5
the needs and aspirations of building users;	5.1
Understanding of the profession of architecture and the role of the architect in society, in particular in preparing briefs that take account of social factors.	GC6
the nature of professionalism and the duties and responsibilities of architects to clients, building users, constructors, co-professionals and the wider society;	6.1
the potential impact of building projects on existing and proposed communities.	6.3
RIBA THEMES AND VALUES AT PART ONE LEVEL	T&V
Histories, Theories, and Methodologies: critically analysing and researching narratives and cultural, environmental, and social values in architecture to understand and extend architectural pedagogy.	4
GRADUATE ATTRIBUTES AT PART ONE LEVEL	GA
ability to evaluate evidence, arguments and assumptions in order to make and present sound judgments within a structured discourse relating to architectural culture, theory and design;	4

AIM(S)

- To provide students with knowledge of the intellectual, economic and political forces that have shaped the built environment in the last two centuries with an emphasis the UK and (in particular) Wales
- To provide students with an understanding of the nature of theory in the field of architecture and related disciplines and basic knowledge of the main themes of architectural theory

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- engage in an informed discussion of the factors that have influenced the design of the built environment in the last two centuries
- design a research project related to architecture that will form the basis of a dissertation to be completed in the third year

INDICATIVE CONTENT

- Analytical study of village, town or neighbourhood in Wales
- Analytical study of the design, construction and philosophy of a seminal building.
- Research methods in architecture and related disciplines
- Dissertation proposal

LEARNING AND TEACHING STRATEGY

Lectures, on-line teaching resources and guided reading introduce the key ideas and themes. Seminars give students the opportunity to explore particular ideas, theories and/or exemplary buildings in detail and assist them in the critical evaluation of knowledge acquired. Lectures and seminars provide students with guidance on the nature of a dissertation, the selection of an appropriate subject and the preparation of a proposal.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement learning		
TOTAL	200	100%

ASSESSMENT

Assessment Component 1

☐ Written exam ☒ Coursework ☐ Practical

Mode of assessment	Volume	Weighting
Essay	2,500 words	40%

Assessment Component 2

☐ Written exam ☒ Coursework ☐ Practical

Mode of assessment	Volume	Weighting
Essay including presentation of outcomes of research	1,500 words + presentation (10 - 15 minutes)	40%

Assessment Component 3

☐ Written exam ☐ Coursework ☒ Practical

Mode of assessment	Volume	Weighting
Dissertation proposal	500 words	20%

Module Code	ACAA5004
Title	Profession and Business 1
Date	13/07/2024
Level	5
Credits	20
Pre-Requisites	None

ARB*/RIBA criteria addressed in this module - * Due to national level changes, ARB prescription of Part 1 (BSc Architecture) will end on December 31st 2027. However, the programme will continue to map to the ARB criteria.	
Adequate knowledge of urban design, planning and the skills involved in the planning process.	GC4
theories of urban design and the planning of communities;	4.1
the influence of the design and development of cities, past and present on the contemporary built environment;	4.2
current planning policy and development control legislation, including social, environmental and economic aspects, and the relevance of these to design development.	4.3
Understanding of the relationship between people and buildings, and between buildings and their environment, and the need to relate buildings and the spaces between them to human needs and scale.	GC5
the needs and aspirations of building users;	5.1
the impact of buildings on the environment, and the precepts of sustainable design;	5.2
the way in which buildings fit into their local context.	
Understanding of the profession of architecture and the role of the architect in society, in particular in preparing briefs that take account of social factors.	GC6
the nature of professionalism and the duties and responsibilities of architects to clients, building users, constructors, co-professionals and the wider society;	6.1
the role of the architect within the design team and construction industry, recognising the importance of current methods and trends in the construction of the built environment;	6.2
the potential impact of building projects on existing and proposed communities.	6.3
Understanding of the methods of investigation and preparation of the brief for a design project.	GC7
the need to appraise and prepare building briefs of diverse scales and types, to define client and user requirements and their appropriateness to site and context;	7.2
the contributions of architects and co-professionals to the formulation of the brief, and the methods of investigation used in its preparation.	7.3
The necessary design skills to meet building users' requirements within the constraints imposed by cost factors and building regulations.	GC10
critically examine the financial factors implied in varying building types, constructional systems, and specification choices, and the impact of these on architectural design;	10.1
understand the cost control mechanisms which operate during the development of a project;	10.2
Adequate knowledge of the industries, organisations, regulations and procedures involved in translating design concepts into buildings and integrating plans into overall planning.	GC11

the fundamental legal, professional and statutory responsibilities of the architect, and the organisations, regulations and procedures involved in the negotiation and approval of architectural designs, including land law, development control, building regulations and health and safety legislation;	11.1
the professional inter-relationships of individuals and organisations involved in procuring and delivering architectural projects, and how these are defined through contractual and organisational structures;	11.2
the basic management theories and business principles related to running both an architect's practice and architectural projects, recognising current and emerging trends in the construction industry.	11.3
RIBA THEMES AND VALUES AT PART ONE LEVEL	T&V
Ethical and Professional Practice: acquiring professional and communication skills to ensure projects are delivered with integrity and accountability within global, national, and professional climate targets.	2
Business Skills: developing capability in business skills relevant to working in practice and practice management	6
GRADUATE ATTRIBUTES AT PART ONE LEVEL	GA
knowledge of the context of the architect and the construction industry, and the professional qualities needed for decision making in complex and unpredictable circumstances;	5

AIM(S)

- To provide students with a basic knowledge of the nature and history of the architectural and other built environment professions and the construction and development industries in the UK
- To provide students with an understanding of the role of the state in the control of development through spatial planning, building regulations and other relevant legislation
- To provide students with knowledge of the nature of the building project from the development of the design brief to post-occupancy evaluation

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- explain concept of 'professionalism' and describe the various roles that architects play in the development process and the construction industry
- identify the legislation that must be complied with when designing and constructing buildings in the UK
- describe the key issues in the procurement of construction working including the selection of design teams and the control of the short and long term cost of construction

INDICATIVE CONTENT

- The architectural profession
- The development and construction industry and built environment professions

- The origins and development of planning and other building control legislation
- Introduction to health and safety
- Universal design
- The legal framework of construction
- Building procurement models

LEARNING AND TEACHING STRATEGY

Lectures, on-line teaching resources and guided reading will introduce the key concepts and principles. In-class workshops and seminars will introduce practical examples, which will be used to support the application, discussion, and critical evaluation of knowledge acquired. Case studies will also be used to develop understanding and application of the principles.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement learning		
TOTAL	200	100%

ASSESSMENT

Date	13/07/2024
Level	5
Credits	20
Pre-Requisites	None

ARB*/RIBA criteria addressed in this module - * Due to national level changes, ARB prescription of Part 1 (BSc Architecture) will end on December 31st 2027. However, the programme will continue to map to the ARB criteria.	
Ability to create architectural designs that satisfy both aesthetic and technical requirements	GC1
understand the constructional and structural systems, the environmental strategies and the regulatory requirements that apply to the design and construction of a comprehensive design project	1.2
Understanding of the relationship between people and buildings, and between buildings and their environment, and the need to relate buildings and the spaces between them to human needs and scale.	GC5
the impact of buildings on the environment, and the precepts of sustainable design;	5.2
Understanding of the methods of investigation and preparation of the brief for a design project.	GC7
the need to critically review precedents relevant to the function, organisation and technological strategy of design proposals;	7.1
Understanding of the structural design, constructional and engineering problems associated with building design.	GC8
the investigation, critical appraisal and selection of alternative structural, constructional and material systems relevant to architectural design;	8.1
strategies for building construction, and ability to integrate knowledge of structural principles and construction techniques;	8.2
the physical properties and characteristics of building materials, components and systems, and the environmental impact of specification choices.	8.3
Adequate knowledge of physical problems and technologies and the function of buildings so as to provide them with internal conditions of comfort and protection against the climate.	GC9
principles associated with designing optimum visual, thermal and acoustic environments;	9.1
systems for environmental comfort realised within relevant precepts of sustainable design;	9.2
strategies for building services, and ability to integrate these in a design project.	9.3
RIBA THEMES AND VALUES AT PART ONE LEVEL	T&V
Health and Life Safety: Demonstrating authoritative knowledge of statutory frameworks to safeguard the community and the end user.	1
Structures, Construction, and Resources: demonstrating climate literacy, responsible specification, and ethical sourcing to enhance wellbeing, minimise embodied carbon, waste, and pollution, and reduce demands on energy and water.	3
GRADUATE ATTRIBUTES AT PART ONE LEVEL	GA
understanding of the alternative materials, processes and techniques that apply to architectural design and building construction;	3

AIM(S)

- To provide the student with knowledge of construction technology and environmental control systems appropriate to the design of non-domestic and multi storey buildings
- To provide the student with knowledge and analytical and synthetic skills relevant to the design of low carbon buildings
- To develop further the student's understanding of the performance of buildings through the analysis of precedent

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Describe accurately the appropriate methods of construction of non-domestic and multi-storey buildings in the UK
- Describe accurately the principles that inform the selection of structural systems and the design of cladding systems for non-domestic and multi-storey buildings in the UK
- Explain the principles that inform the definition of an environmental design strategy for a large non-domestic building in the UK.

INDICATIVE CONTENT

- Building frames – steel, concrete and timber
- Cladding systems
- Multi- storey design – lifts, stair and cores
- Ventilation, heating and cooling in non-domestic buildings
- Building services
- Low carbon design and energy modelling

LEARNING AND TEACHING STRATEGY

Lectures, on-line teaching resources and guided reading will introduce the key concepts and principles. In-class workshops and seminars will introduce practical examples, which will be used to support the application, discussion, and critical evaluation of knowledge acquired. Case studies will also be used to develop understanding and application of the principles.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage

MODULE CODE: ACBA5000
TITLE: Modern and Traditional Construction: Managing the Design and Construction Process
DATED: 16/08/2018
LEVEL: 5
CREDITS: 20
JACS CODE: K220

AIM

- For students to build on the principles developed in Fundamentals of Construction Technology and further develop these in their application to taller and wider spanning structures. Key to this aim will be the study of creating internal flexibility to a range of building types.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Appraise a range of materials, techniques and constructional forms suited to the construction of medium to high-rise buildings.
- Understand the concepts of buildability, sustainability and flexibility applied to a range of commercial building structures both modern and those built in the past one hundred and fifty years.
- Deploy appropriate methods to the alteration, remediation and deconstruction of a range of building forms and applications.

INDICATIVE CONTENT

Constructional designs and techniques applicable to medium, wide-span and high-rise buildings:

- Structural frames
- Demolition, Shoring, Facade Retention systems
- Shallow Basements their construction and waterproofing
- Building envelopes
- Structural floors
- Fit-out and finishes
- Integration of Building Services
- Specification of materials
- Flat and pitched roofing systems applicable to commercial and industrial buildings
- The drive towards the production of intelligent buildings:
- Incorporating flexibility in the design of commercial buildings
- Suspended ceiling systems, raised floors and demountable partitioning
- The significance of ICT and how it impacts on the design of modern or refurbished structures
- Services provision
- Sustainability and building ecology
- The concept of buildability, its link with constructability and sustainability
- Building refurbishment: alteration, remediation and the decision to deconstruct

- Health and Safety measures as applicable to these forms of construction

LEARNING AND TEACHING STRATEGY

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement Learning	0	0%
TOTAL	200	100%

MODULE CODE: ACBA5001
TITLE: Project Planning for Construction
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K220

AIM

- To provide students with the tools and analytical skills with which a construction manager can plan and programme a construction project.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Determine and assess the principles and application of effective project planning and programming.
- Produce method statements and programme of works, analysing time, cost and resources needed for the project construction.
- Evaluate the implications of quality; environmental considerations; health and safety, and how to plan them on site.

INDICATIVE CONTENT

- Principles of management
- Effective communication and documentation for construction projects
- Site investigation
- Method statements
- Productivity and costing. Cash-flow forecast analysis
- Programming. Gantt charts and arrow diagrams
- Programming resources
- Planning quality control, quality assurance and quality management
- Environmental management
- Waste management plans
- Quality and monitoring methods and procedures

%MODULE CODE: ACBA5002
TITLE: Property Inspection and Re-use of Buildings
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K230

AIM

- To develop an appreciation of building inspection processes, methods of recording areas of decay, refurbishment requirements, energy efficiency and the challenges of retro-fitting and re-using existing buildings.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate the principal agents and causes of deterioration and decay in building.
- Prepare drawings and specifications for the modification of an appropriate existing building.
- Examine the principles of energy efficiency and the challenges this generates when rehabilitating buildings.

INDICATIVE CONTENT

- Understand the principal agents, and the causes of deterioration and decay of buildings and their components
- Sources of deterioration and decay: human, chemical, atmospheric, structural, moisture and fire;
- Faults in: design, workmanship, materials, systems, components, maintenance, problems of vandalism;
- Key factors in the design process, which have led to building failures.
- Appraisal
- Assess the useful life of property, components and materials:
- Determination of the useful life of an existing property, forecasting useful life for a new property;
- Methods of assessing the useful life of components and materials.
- Effects of useful life and dilapidation estimates on economic decisions concerning choice, extent and quality of work to be undertaken.
- Determination of financial decisions concerning repair, renewals or rebuilding.
- Principal ways by which human, chemical, atmospheric, structural, moisture and fire factors lead to the decay of, and damage to, buildings, their services and materials by surveying existing buildings.
- Recording the most common forms of decay and deterioration, preparing report documents.
- Determine the remedial requirements for the decay and deterioration.
- Presenting these in formats that are commonly used by industry.
- Drawings and Specifications

- Produce drawing and specifications for a typical building alongside the design solution to meet planning and building control requirements. Outline proposals for a suitable conversion, extension or adaptation of an existing building.
- Energy Efficiency and Reports
- Identify the information necessary for calculating energy efficiency.
- Understand the context of the energy performance certificate for domestic dwellings.

LEARNING AND TEACHING STRATEGY

MODULE CODE: ACBA5003
TITLE: Principles of Measurement and Estimating
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K240

AIM

- To develop essential skills in interpreting drawings and an understanding of the quantity surveying techniques of measurement for the compilation of tender information using industry standard methods of measurement.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Critically appraise standard measurement techniques used for taking off quantities for estimating purposes.
- Identify and interpret the data necessary for inclusion into a tender document for competitive pricing.

INDICATIVE CONTENT

- The use of standard methods for the measurement and recording of quantities
- Techniques for quantifying budget
- Calculation of unit rates in building up an estimate
- The significance of the tendering process in procurement
- Standard methods of measurement for Industry, e.g. The Royal Institution of Chartered Surveyors (RICS) New Rules of Measurement for the measurement and recording of data.
- Preparation of appropriate documentation, including Bills of Quantities for the tendering processes.
- Application of Industry appropriate software.

LEARNING AND TEACHING STRATEGY

The study time for the module is divided as follows:

MODULE CODE: ACBA5004
TITLE: Geotechnical & Foundation Technology
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K200

AIM

- To provide learners with skills to classify rock and soil types and structure to establish primary engineering design parameters for soils; current codes of practice and criteria for testing the stability of foundations and earthworks.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate the principle classification methods for soil and rock types in order to establish mechanical, physical and engineering design parameters
- Critically analyse and interpret the characteristics, procedures and significance of data, in line with current codes of practice
- Apply geological mapping to the interpretation of ground conditions for foundation and earthworks stability.
- Apply hydraulics and fluid mechanics within the context of permeability and seepage flow of percolating ground waters.

INDICATIVE CONTENT

- Geological structures: petrographic classification of igneous, sedimentary and metamorphic rock types; common stable and unstable minerals and their geographical/geological distribution.
- Characteristics of discontinuities which influence the engineering performance of rock materials, stability of foundations, consolidation and compaction, settlement, angle of repose and bearing capacity.
- Rock and un-cemented sediments for construction use.
- Current techniques for the acquisition of soil and rock samples for laboratory testing; impact of sample quality on measured parameters, common methods of in-situ testing.
- Laboratory measurements of soil density, moisture content, permeability, porosity and determination of shear strength using shear box and tri-axial tests.
- Mohr's circles of stresses.
- The Atterburg limits.
- Soil description and classification: classifications to current codes of practice.
- Particulate nature of soils; The Soil Model, three-phase and two-phase states, calculations for mass, density, moisture content, void ratio and degree of saturation, porosity, cohesion and specific gravity.
- Principles of effective stresses: influence on the strength and deformation of soil, drained and undrained behaviour; influence of seepage on effective stress.
- Hydraulics and Fluid Mechanics as used in foundation technology.

MODULE CODE: ACBA5005
TITLE: Materials Engineering
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K200

AIM

- To introduce students to innovative composite materials and processes and to the analysis of concrete performance, its physical, mechanical and chemical properties, test, and quality control procedures.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Understand and evaluate innovative advances in material use and application, as well as the mechanical and physical properties of concrete, steel, timber, flexible and rigid pavements.
- Apply scientific principles to evaluate new material performance for specific site conditions, sustainability and the environment.
- Apply the characteristics of fresh and hardened concrete and the constituent materials to the design of concrete mixes and quality control techniques.

INDICATIVE CONTENT

- Material advances: Fibre Reinforcement (plastics, rubbers, foams, Textiles), expanded glass aggregate, restrained cracking, crack distribution, chemically bound aggregates, treated and stabilised soils, Replaced aggregates, properties of recycled aggregates, slag-based geopolymer, geo-textiles and geo-composites, SUDs and Permeable pavements.
- Material Evaluation: As appropriate to field of study e.g. Behaviour in Use, material degradation, failure, fracture, fracture mechanics (Concrete, Steel, Timber, Flexible and Rigid pavements), use of renewable and non-renewable resources in composite manufacture.
- Physical, mechanical and chemical properties of aggregates, cement and water.
- Concrete mixes. Proportions by volume and weight, water/cement and cement/aggregates ratios, mix design.
- Admixtures and additions. Characteristics and effects on concrete mixes.
- Fresh concrete. Properties, mixing, transport, placing and compaction.
- Hardened concrete. Physical, mechanical and chemical properties.
- Laboratory testing. Sampling, aggregates testing (sieve analysis, fines content, density, shape, etc.) fresh concrete consistence, workability, compressive/tensile strength of concrete, etc.
- Design and characteristic strength.
- Application of statistics to concrete quality control.
- Special concretes. Self-compacting, sprayed, high-strength, etc.

- Concrete sustainability. Embodied energy, recycled aggregates for infrastructure solutions, use of waste materials (old tyres, C&D waste, fly ash/bottom ash, slurry, plastics, etc.), replacement of aggregates and cement, biopolymers, research being developed, etc.

LEARNING AND TEACHING STRATEGY

MODULE CODE: ACBA5006
TITLE: Project Control & Contract Administration
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K220

AIM

- To provide students with an understanding of the common methods of procurement and the factors that affect the selection of procurement routes. To provide tools of analysis and decision-making to the construction manager to be able to control and monitor the project construction stage.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate the factors that affect the selection of construction procurement methods.
- Demonstrate project-management control procedures to monitor progress and supply of resources.
- Assess and calculate contract variations including the assessment of claims

INDICATIVE CONTENT

- Selection of procurement route
- Construction procurement methods and contractual arrangements.
- Monitoring progress of site works
- Management of materials supply
- Waste management
- Management of expenditure against budget
- Preparation of interim valuations
- Preparation , negotiation and documentation of claims
- Assessment of variations
- Delay and disruption. Delay analysis

AIM

- To introduce the students to the methods, techniques and technical requirements used to create civil engineering structures such as substructures and superstructures, and to provide an appreciation of site hazards and health, safety and welfare legislation.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Critically appraise methods and resources used in earthworks, substructure activities and in the construction of superstructures.
- Comparatively evaluate methods and techniques used in tunnelling activities, in hydraulic and marine structures and in highway and railway construction.

INDICATIVE CONTENT

- Introduction to earthmoving, equipment and techniques.
- Methods and resources required to ensure safe and productive operations in grounds works.
- Deep and shallow excavations, trenching and working at height.
- Substructure, drainage and tunnelling activities
- Piling systems and ground stabilization activities, including cofferdams, caissons, and seawalls.
- Foundation constructions.
- Drainage works
- Construction of superstructures.
- Highway and Railway constructions.

MODULE CODE: ACBA5008
TITLE: Self-Development, Professional Practice and the Management of Construction Personnel
DATED: 16/08/2018
LEVEL: 5
CREDITS: 20
JACS CODE: K220

AIM

- To provide students with the knowledge required in order to manage personnel on construction projects effectively and to develop a clear understanding of the role of a professional in practice. This will include developing their understanding of continuing professional practice and reflection in practice.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Identify the role of human resource management in the construction industry and appraise the impact of employment legislation that falls within the responsibility of the construction manager
- Evaluate the ethical requirements of professional practice through the codes of practice available and gain an appreciation and understanding of the principles, tools, methods and processes of consultancy and professionalism

INDICATIVE CONTENT

- The site manager's role in the organisation
- The theories of motivation for individuals and teams
- Contemporary methods for managing teams
- Methods of managing conflict within teams
- Employee rights and responsibilities of site personnel
- The impact of employment legislation on managing a construction site
- Methods for measuring performance of individuals and teams
- Ethical frameworks for raising professional standards in the construction industry
- The importance of continuous professional development for the site manager and site personnel
- An organisation's procedures for managing performance including capability and disciplinary measures
- Communication methods for improving project outcomes
- Professional services agreement
- Codes of practice for Professional bodies
- Planning and Building regulations
- Ethics in practice
- Practice and management
- Conflict resolution

LEARNING AND TEACHING STRATEGY

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24
Independent learning	152	76
Placement learning	0	0
TOTAL	200	100

ASSESSMENT

Assessment Component 1

(Tick one)

MODULE CODE: ACBA5009
TITLE: Work Based Project
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K220

AIM

- To provide students with the opportunity to critically reflect on current trends applicable to working environments in a selected place of work relevant to their degree path.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate current significant challenges relevant to the work place.
- Assess different working approaches and critically justify their appropriateness for a range of working activities.

INDICATIVE CONTENT

- The impact work practices and workplaces have on built environment professions.
- Assess the role of the physical infrastructure in achieving workplace goals e.g. site office, HQ etc.
- The role of supporting services in the functioning of the workplace.
- The role of sub-contractors and professional bodies.
- The role and function of various departments e.g. HR.
- Evaluate the function and implementation of meetings.
- Evaluate communication systems within and between organisation involved in the project e.g. planners, construction firm.
- Consider how different professions and trades interact within the organisation.
- Psychology and the workplace.
- Time management
- Identify and consider individual development goals

LEARNING AND TEACHING STRATEGY

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	40	20%
Independent learning	160	80%
Placement learning	0	0%
TOTAL	200	100%

MODULE CODE: ACBA5010
TITLE: BIM
DATED: 16/08/2018

LEVEL: 5
CREDITS: 20

JACS CODE: K200

AIM

- To provide learners with the skills needed to analyse, classify and produce two and three-dimensional drawings using industry-standard computer-aided design (CAD) software, as well as evaluating and applying knowledge of the information delivery cycle in Building Information Modelling (BIM) and its influence upon project efficiency.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Demonstrate an ability to analyse, classify and produce 2D and 3D drawings using industry-standard CAD software applications.
- Demonstrate an ability to render drawings to various scales and media and export drawings to different formats.
- Comprehend and apply the functions and processes needed to manage the life cycle of a built structure in a Building Information Modelling environment and subsequently to produce digital data.

INDICATIVE CONTENT

- Evaluate, classify and analyse 2D drawings using industry-standard CAD software applications
- Critically analyse and produce 3D models using industry-standard CAD software applications
- Evaluate and apply rendering to 2D and 3D drawings
- Define and apply the functions and processes needed to manage the life cycle of a built structure in a Building Information Modelling environment
- Critically appraise the production of digital data for built structures
- Define and classify the preparation of Building Information Models using industry standard software
- Evaluate and apply techniques to extract data from prepared Building Information Models to satisfy several different requirements

LEARNING AND TEACHING STRATEGY

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement learning	0	0%
TOTAL	200	100%

Module Code	ACBA5014
Title	Changemakers: Creativity and Value Creation
Date	25/06/2020
Level	5
Credits	20
Pre-Requisites	None

AIM(S)

- To develop the concepts and practice of creativity and value creation for the development of innovative, aspiring and progressive solutions.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Demonstrate knowledge and critical understanding of innovation, creativity and enterprising mindset, recognising the values and the contribution creativity makes to the common good.
- Conceive, articulate and apply creative thinking within a work-based or academic context to develop novel solutions and/or value creation.

INDICATIVE CONTENT

- Creativity in theory and practice.
- Value creation in theory and practice.
- Creative and ethical leadership: skills and challenges.
- Driving innovation and change, the intra and entrepreneurial individual.
- Critical thinking, troubleshooting and problem solving, developing novel solutions.
- Information gathering for inspiration, vision creation and ideation.
- Developing the enterprising and data driven mindset.
- Contemporary technologies: virtual and augmented reality and artificial intelligence to enhance creativity and innovation.
- Time management practices for an entrepreneurial mindset.
- Being resourceful, in the context of making do with less.
- Reflection and self-reflection.

Study Time Allocation

Title	Advanced Estimating and Tendering
Date	20/05/2024
Level	5
Credits	20
Pre-Requisites	None
DBS Check	May be required ☐ Not required ☒

AIM(S)

- To develop essential skills in interpreting drawings and an understanding of the quantity surveying techniques of measurement for the compilation of tender information using industry standard methods of measurement.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- critically appraise standard measurement techniques used for taking off quantities for estimating purposes;
- identify and interpret the data necessary for inclusion into a tender document for competitive pricing.

INDICATIVE CONTENT

- The use of standard methods for the measurement and recording of quantities.
- Techniques for quantifying budget.
- Calculation of unit rates in building up an estimate.
- The significance of the tendering process in procurement
- Standard methods of measurement for Industry, e.g. The Royal Institution of Chartered Surveyors (RICS) New Rules of Measurement for the measurement and recording of data.
- Preparation of appropriate documentation, including Bills of Quantities and elemental cost plan for the tendering processes.
- Application of Industry appropriate software.

AIM(S)

- To provide learners with the skills needed to analyse, classify and produce two and three-dimensional drawings using industry-standard software, as well as evaluating and applying knowledge of the information delivery cycle in Building Information Modelling (BIM) and its influence upon project efficiency through a collaborative process.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- demonstrate an ability to analyse, classify and produce 2D and 3D drawings using industry-standard software applications;
- demonstrate an ability to render drawings to various scales and media and export drawings to different formats;
- comprehend and manage the life cycle of a built structure in a Building Information Modelling environment and subsequently to produce digital data through the collaborative process.

INDICATIVE CONTENT

- Classification and analysis of drawings using industry-standard software applications.
- Data rich (3D) models.
- Rendering to 3D drawings and explore Virtual Reality (VR) & Augmented Reality (AR) capabilities.
- Functions and processes needed to manage the life cycle of a built structure in a Building Information Modelling environment.
- Production of digital data for built structures through the use of collaborative platforms.
- Extraction of data from prepared Building Information Models to satisfy several different requirements.
- Intellectual property within the innovation process.
- Extraction of BIM data from a prepared model.

Module Code	ACBA5017
Title	Building Services 2 - Integration
Date	20/05/2024
Level	5
Credits	20
Pre-Requisites	None
DBS Check	May be required ☐ Not required ☒

AIM(S)

- To introduce the broad application of technologies and sustainable design and installation techniques used to satisfy the building service requirements within buildings.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- comprehend Building Services technologies that serve large commercial, multi-zone and domestic buildings;
- critically appraise the system and equipment choice, design and installation practice, in the context of sustainable futures, lifecycle, energy and cost savings;
- recognise the requirements for safe installation and maintenance access and provision.

INDICATIVE CONTENT

- Heating, Ventilation, and Air Conditioning (HVAC) systems – characteristics and choices, routing.
- Heating Systems – Centralised and localised systems, system sizing and emplacement. Calculative analysis of reasons for choice.
- Ventilation and air conditioning systems – Natural and Mechanical types and their suitability for use, given building type and environmental considerations. Air Handling Unit (AHU's), fan coil unit (FCU's), Vent intake and extraction sizing.
- Ductwork, types, sizing and installation requirements. Airflow calculation.
- Below and above ground building waste collection and disposal. Risk associated with system install and system type. Choosing the correct system for the building.
- Hot and Cold water provision, radiator system types, Boiler types and their sizing for adequate supply and energy conservation.
- SMART buildings.
- Lifecycle assessment.

Study Time Allocation

Title	Business Management for Construction
Date	20/05/2024
Level	5
Credits	10
Pre-Requisites	None
DBS Check	May be required ☐ Not required ☒

AIM(S)

- To introduce the concepts of business and financial management, focusing on understanding the business strategies employed by construction companies.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- define the various legal status of construction companies and evaluate the sources of finance available and how finance can be managed;
- evaluate the effectiveness of different forms of company organisation and entrepreneurship;
- describe the ways in which resources can be managed.

INDICATIVE CONTENT

- Company types including sole trader, private company, public company etc.
- Legal requirements for companies.
- Company closure.
- Capital including short, medium and long term.
- Finance.
- Company accounts.
- Organisational structures.
- Management theory.
- Human resource management.

AIM(S)

- To further develop understanding of previously established principles with their application to high rise and wider spanning structures, and the implementation of sustainable approaches to material choice, internal flexibility and the environment in which the building stands.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- appraise a range of materials, methodological techniques and constructional forms suited to medium to high-rise buildings;
- explain the concepts of buildability, sustainability and flexibility when applied to a range of building structures.

INDICATIVE CONTENT

- Structural Frames, basement construction in variable ground conditions, structural floors.
- Building envelopes, material and method choices, off-site.
- prefabrication/construction, automation and on-site build, modular forms.
- Environmental impact in orientation. Life cycle, longevity, and aesthetics. Wind loading.
- Façade retention systems.
- Façade greening, Sustainable Urban Drainage Systems (SUDS).
- Incorporation of flexibility in design and use.
- Consideration of buildability and sustainability.
- Building alteration, renovation, remediation of defects and the decision to de-construct.
- De-construction, demolition, and recycling potential.

AIM(S)

- To provide students with an understanding of common procurement methods and the factors influencing their selection, along with an understanding of contractual procedures.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- evaluate the factors that affect the selection of construction procurement methods;
- demonstrate project-management control and contract procedures to monitor progress and supply of resources.

INDICATIVE CONTENT

- Selection of procurement route.
- Construction procurement methods and contractual arrangements.
- Management of construction contracts such as Joint Contracts Tribunal (JCT) and New Engineering Contract (NEC).
- Monitoring progress of site works including Gantt Charts.
- Management of materials supply.
- Payments, responsibilities etc.

AIM(S)

- To provide learners with skills to classify rock and soil types and structure to establish primary engineering design parameters for soils; current codes of practice and criteria for testing the stability of foundations and earthworks.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- evaluate the principle classification methods for soil and rock types in order to establish mechanical, physical and engineering design parameters;
- critically analyse and interpret the characteristics, procedures and significance of data, in line with current codes of practice;
- apply geological mapping to the interpretation of ground conditions for foundation and earthworks stability;
- apply hydraulics and fluid mechanics within the context of permeability and seepage flow of percolating ground waters.

INDICATIVE CONTENT

- Geological structures: petrographic classification of igneous, sedimentary and metamorphic rock types; common stable and unstable minerals and their geographical/geological distribution.
- Characteristics of discontinuities which influence the engineering performance of rock materials, stability of foundations, consolidation and compaction, settlement, angle of repose and bearing capacity.
- Rock and un-cemented sediments for construction use.
- Current techniques for the acquisition of soil and rock samples for laboratory testing; impact of sample quality on measured parameters, common methods of in-situ testing.
- Laboratory measurements of soil density, moisture content, permeability, porosity and determination of shear strength using shear box and tri-axial tests.
- Mohr's circles of stresses.
- The Atterburg limits.

- Soil description and classification: classifications to current codes of practice.
- Particulate nature of soils; The Soil Model, three-phase and two-phase states, calculations for mass, density, moisture content, void ratio and degree of saturation, porosity, cohesion and specific gravity.
- Principles of effective stresses: influence on the strength and deformation of soil, drained and undrained behaviour; influence of seepage on effective stress.
- Hydraulics and Fluid Mechanics as used in foundation technology.

Module Code	ACBA5022
Title	Materials Engineering
Date	20/05/2024
Level	5
Credits	10
Pre-Requisites	None
DBS Check	May be required ☐ Not required ☒

AIM(S)

- To further develop understanding of a range of materials for civil engineers. Concrete timber and masonry will be examined in terms of structural behaviour, analysis and design.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- describe concrete design in terms of manufacture, composition and hydration including aggregates and admixtures;
- explain the required tests to check the quality of concrete and interpret results;
- explain tests to check the quality of steel and timber and interpret results.

INDICATIVE CONTENT

- Materials Specification.
- Casting of concrete samples. Moulding and curing to assess properties and quality.
- Evaluation of the structural behaviour of concrete, timber and steel.
- The mechanical properties of concrete.
- Understand the link between sustainability and the manufacture of cement and concrete.
- Understand the latest UK regulatory framework around concrete, steel and timber.
- The quantitative and qualitative structural analysis of materials.
- Stress and strain structural analysis of materials.

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	24	24%
Independent learning	76	76%

AIM(S)

- To provide tools of analysis and decision-making to the quantity surveyor to be able to control and monitor finances during the project construction stage.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- apply knowledge of financial management to assess and calculate contract variations including the assessment of claims for scenarios.

INDICATIVE CONTENT

- Management of expenditure against budget.
- Preparation of interim valuations.
- Preparation, negotiation and documentation of claims.
- Assessment of variations.
- Risk management (financial etc).
- Delay and disruption.
- Delay analysis.

AIM(S)

- To develop an understanding of the importance of research within the construction industry.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- recognise the use and pros and cons of different research methodologies;
- demonstrate understanding of ethical responsibilities within research;
- to produce a research proposal and a pilot study piece of research.

INDICATIVE CONTENT

- Define research and types of research.
- Research methodologies.
- Approaches to research.
- Literature searches.
- Data gathering.
- Sampling methods.
- Analysis of data.
- Ethics.
- Presenting data.

AIM(S)

- To provide students with the tools and analytical skills with which a construction manager can plan and programme a construction project as a team.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- determine and assess the principles and application of effective project planning and programming;
- produce method statements and programme of works, analysing time, cost and resources needed for the project construction;
- evaluate the implications of quality; environmental considerations; health and safety, and how to plan them on site.

INDICATIVE CONTENT

- Principles of management.
- Effective communication and documentation for construction projects.
- Site investigation.
- Method statements.
- Productivity and costing. Cash-flow forecast analysis.
- Programming. Gantt charts and arrow diagrams.
- Programming resources.
- Planning quality control, quality assurance and quality management.
- Environmental management.
- Waste management plans.
- Quality and monitoring methods and procedure.
- Collaboration.

Module Code	ACBA5026
Title	Retrofit Coordination and Management
Date	20/05/2024
Level	5
Credits	20
Pre-Requisites	None
DBS Check	May be required ☐ Not required ☒

AIM(S)

- To equip students with the understanding of the need for the retrofit of the existing building stock, with a particular focus on domestic construction, including outlining the technologies viewed as low carbon, material and construction method selection, systems, and their challenges, with the need to move to a zero-carbon society within the context of decarbonisation.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- evaluate the theory and practice in the applicability of a range of technologies in relation to the retrofit of existing buildings to align with carbon emission reduction and sustainability;
- consider and apply appropriate solutions for retrofit applied to given scenarios.

INDICATIVE CONTENT

- The need for decarbonisation in context of global, national, and local policies and legislation.
- Historical context and evaluation of the progress towards retrofit, considering the key sectors across the UK within the building industry.
- The performance gap and building performance evaluation.
- Reality and the design and build process.
- Retrofit and conservation outlining the significance of thorough surveys.
- User interface, control, and maintenance.
- Construction, coordination, and skills challenges for retrofit.
- The devil in the detail. Building element retrofit interface issues for walls, roofs, floors, windows, doors, building services, sustainable technologies.
- Managing expectations and the costs of retrofit.
- Collaboration.

AIM(S)

- To equip students with the ability to be able to analyse indeterminate structures.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- resolve the forces in trusses and frameworks;
- carry out beam and frame analysis of indeterminate structures.

INDICATIVE CONTENT

- Structural classification into determinate and indeterminate structures.
- Introduction to the beam theory and analysis of simply supported and cantilevered beams.
- Analysis of indeterminate structures: Beams and Frame Analysis.
- Flexibility and Moment methods to solve statically indeterminate structures.
- Moment Distribution Method for analysing indeterminate beam and frame structure.
- Moment area method for analysing indeterminate beam and frame structure.
- Method of sections, "BOW" notation and Resolution of forces techniques to determine member forces in trusses and frameworks.
- Introduction to loading analysis on structure.
- Introduction CAD application to structural modelling and analysis.

AIM(S)

- To provide students with details of the Sustainable Development agenda related to construction, and its impact on practices moving into the future.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- evaluate the development of the Sustainable Development agenda and its relationship to the construction sector;
- apply sustainability thinking to a simple project scenario.

INDICATIVE CONTENT

- The fundamentals of Sustainable Development (concept, principles, challenges).
- Policy and legislative context related to construction (UK, worldwide).
- Tools for decision making (BREEAM, LEED, etc).
- Urban environments, infrastructure and the need for change.
- Modern Methods of Construction and the links to Sustainable Development.
- Embodied carbon calculations.
- Circular Economy in construction.
- Sustainable Development as an agent for progress related to global climate change.

Module Code	ACNA5000
Title	Changemakers: Building your Personal Brand for Sustainable Employment
Date	25/06/2020
Level	5
Credits	20
Pre-Requisites	none

AIM(S)

- To build the skills and competencies necessary for career resilience and professional development for the future work context.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate personal employability skills and their congruence with the skills required for professional practice in a real or simulated environment.
- Build a personal brand and promote a professional identity for a specific opportunity.

INDICATIVE CONTENT

- Analysing your employment sector in order to identify problems, gaps in the market and how you can add value for sustainable employability.
- Building your brand and promoting a professional identity through personal skills analysis and personal development planning.
- Contemporary technologies: developing an online personal presence (e.g. basic website building/social media/blogs/vlogs etc.).
- Search techniques for employment/self-employment opportunities.
- Adopting project management approaches (defining the problem; setting the goals and objectives, milestones and monitoring, evaluation).
- Collaboration, networking, building social capital, negotiation and influencing.
- Awareness, emotional intelligence, well-being and resilience.
- Ethics, values, diversity, inclusion, intercultural awareness and responsible stewardship: issues, challenges and actions.
- Cultural and linguistic expression.

Module Code	ACNA5001
Title	Coastal, Marine and Wildlife Conservation
Date	05/05/2021
Level	5
Credits	20
Pre-Requisites	None

AIM(S)

- To introduce coastal and marine ecosystems, and their conservation. From a scientific consideration of these pressures, students will evaluate strategies for the protection of the maritime environment and wider conservation of species, ecosystems and natural resources.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Comprehend the functioning of coastal and marine systems
- Discuss current conservation issues affecting the coastline/inshore waters and evaluate coastal defence strategies
- Contextualise and demonstrate awareness of the science and practicalities of wildlife conservation, sustainability and wildlife exploitation.

INDICATIVE CONTENT

- Introduction to the functioning of the marine environment
- Pollution and impacts – microplastics and hydrocarbons
- Oceanic over-harvesting and future implications of key policies.
- Role of oceans in climate regulation
- Impacts of climate change on marine systems.
- Sustainable management of marine wildlife
- Coastal geomorphology and the impact of anthropogenic forces
- Ecosystem services in coastal environments
- Climate change and coastal adaption
- Coastal priorities and management in a changing demography
- Coastal Zone Management, vulnerability and resilience in a changing world
- Wildlife Handling, Ethics and Conservation
- ID Skills and Population Assessment

- Rewilding, Species and Landscape Approach
- Making Space for Wildlife in an Urban Setting
- Green prescribing and the role of Ecological Engagement in the Community

Study Time Allocation

The study time for the module is divided as follows:

Module Code	ACNA5002
Title	Environmental Legislation and Circular Economy
Date	05/05/2021
Level	5
Credits	20
Pre-Requisites	None

AIM(S)

- To enable students to make informed judgments concerning the principal legal aspects relating to the environment, as well as outlining the importance of circular economy in policy and practice.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Use and apply legal materials that influence the environment and apply these to a range of case study scenarios
- Introduce the circular economy and its importance of policy and practice

INDICATIVE CONTENT

- Introduction of the legal framework for England and Wales
- Identification of key stakeholders within the legal and policy framework, and their respective roles and responsibilities for the environment
- Coverage of key legal controls for differing environmental media
- Introduction to the circular economy, its associated policy framework and importance globally, nationally and locally
- Underlying principles of circular economy, including progress towards achievement via case studies that demonstrate the fundamentals (globally, nationally and locally).

Study Time Allocation

Module Code	ACNA5003
Title	Low Carbon Technologies
Date	05/05/2021
Level	5
Credits	20
Pre-Requisites	None

AIM(S)

- To equip students with the understanding of the need for decarbonisation, including outlining the technologies viewed as low carbon, grid distribution systems and their challenges, and the need to move to a zero-waste society within the context of decarbonisation.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Evaluate the applicability of a range of technologies in relation to carbon emission reduction, selecting those most appropriate to given scenarios
- Debate the merits and demerits between theory and practice.

INDICATIVE CONTENT

- The need for decarbonisation in context of global, national and local policies and legislation.
- Evaluation of the progress towards decarbonisation, considering the key sectors across the UK such as waste management.
- The Psychology of waste
- Evaluation of current and emerging low carbon technologies to replace historic energy generation technologies.
- Consideration of delivery systems, including the current grid distribution system and future developments.
- The need to consider energy efficiency in all aspects (building, appliance, transport, etc.)

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement learning		
TOTAL	200	100%

ASSESSMENT

Assessment Component 1

(Tick one)

☐ Written exam ☒ Coursework ☐ Practical

Mode of assessment	Volume	Weighting
Assignment	3500 words	70%

Assessment Component 2

(Tick one)

☐ Written exam ☐ Coursework ☒ Practical

Mode of assessment	Volume	Weighting
Oral presentation	12 minutes	30%

Assessment Summary

Activity type	Percentage
Written exam	0
Coursework	70%
Practical	30%
TOTAL	100%

Module Code	ACNA5004
Title	Water Resources and Environmental Monitoring
Date	05/05/2021
Level	5
Credits	20
Pre-Requisites	None

AIM(S)

- To enable students to critically evaluate and appraise the conservation of water resources from a multidisciplinary point of view.

LEARNING OUTCOMES

Upon the successful completion of this module, the student should be able to:

- Appraise water resources and the physical, chemical, biological and human factors affecting them.
- Determine the quality of water resources and their surrounding environments through statistical analyses, and applying the principles and concepts of watershed management.
- Evaluate the possible contradictions arising from human activities, economic development and the current need to conserve a scarce resource.

INDICATIVE CONTENT

- Hydrology (scarcity, distribution & movement of water resources) and watershed analysis
- Water availability and political conflict
- Water pollution, wastewater, treatment & modelling
- Biological and chemical sampling & statistical analysis methods
- Waterborne diseases
- Water and flood management (including droughts, floods and reduction of environmental impacts)
- Watershed analysis
- Groundwater, abstraction & aquifers
- Water purification
- Ecosystem services and water resources (lakes, dams & resevoirs)
- The physical, chemical and biological parameters of water

- Assimilation of pollution in fresh water
- Ground and surface water pollution, and subsequent removal of pollutants
- Potable and wastewater treatment processes

Study Time Allocation

The study time for the module is divided as follows:

Activity type	Hours	Percentage
Scheduled learning	48	24%
Independent learning	152	76%
Placement learning		
TOTAL	200	100%
