

designing with people.com this website really helped categorise the common issues with people who suffer with a certain living conditions when living their daily lives and carrying out their current activities and reading some of these case studies also picture and videos however it was a bit of an outdated site and the link were no longer active for me to watch these common problems a day in the life of people with certain conditions also helped and especially certain phrases and quotes each person has said was quite interesting to see how it affected those people individually.howevee

After looking through the designing with people website, this was a website which explore all ways of designing with people and many categories of daily activities of daily living, which for some peoples may seem easy and some not, methods, ethics which designer to consider also a variant type of people which have been set as character profiles of common problems or current issues they may have to do with their everyday life as I look more into the website at the start of this project we had to explore this website to decide upon three types of categories which us ourselves would look into with some primary and secondary research of our closest relatives or worldwide social media family and friend with the benefits of social media to bring in results from specified criteria that as a group had decided upon

When deciding upon the categories of designing with people myself I had decided for; **Digital communications** as in my family I have member which have a product of some certain technology like an apple or android smartphone, even computers which they have not use in and don't know what to do with it so this is why I wanted to explore more with this area to see why and I found out a lot.

Home maintenance as I find this could be another big area of solutions because having the ability of living by yourself independently is an important activity of daily living and for some this could be a struggle that's why when I visited relative and family to find out research to my needs of certain criteria I found that

Community mobility

Family members to go and find I thought was really good as result in which I could be of more interest with what condition they live with and find difficulties with as a lot of my family live close and far however to family circumstances this was a bit of disadvantages idea as I don't speak to many of them or see them which is rather sad but I worked around as

The member which I hadn't got around to getting the information from to help me with research of categories I could look into

out of 5 member of family to find out research about also if they were happy enough to discuss their condition and with pass this data

I have a nan which I believe is coming up around 70 years old which has bad eyes , hearing bad bone of some condition, still currently driving, lives on her own

My auntie which had recently an operation on her stomach and has to live with a bag to carry around with here which may be revealing if not positioned properly and also How hoard and difficult if maybe for her to go out anywhere whether this maybe to the supermarket on a night out and also activities to carry on with around the house which lives on her own lives far away

what categories I could find information about and this is why I had chosen my three

My grandad - has a bad leg so moving about or home is a bit hard that he used to be a retired building/demolition manager and that he is aged 64 which is rather elderly and the common problems he has are Disability injured in 1999 retired in 2001

Bad eyes, deaf in one ear lives on his own

MY Uncle is 51 and is currently a taxi driver although use to be a lorry/ logistics driver however came from that when he had suffer with current back problems and stiffness and wears glasses due to bad vision but doesn't suffer with any disabilities

My Auntie is aged 45 currently works as a carer so works long hours struggles with the everyday activities due to hours and certain timing of which hours she has decided to work the amount of lifting and organising of people and elderly in a care home which could be a lot of work and travelling far from home so being constantly tired she even has problems with her hands where they cramp up and she has constant spasms had many operations and physio's classes to make her hand useful with ease

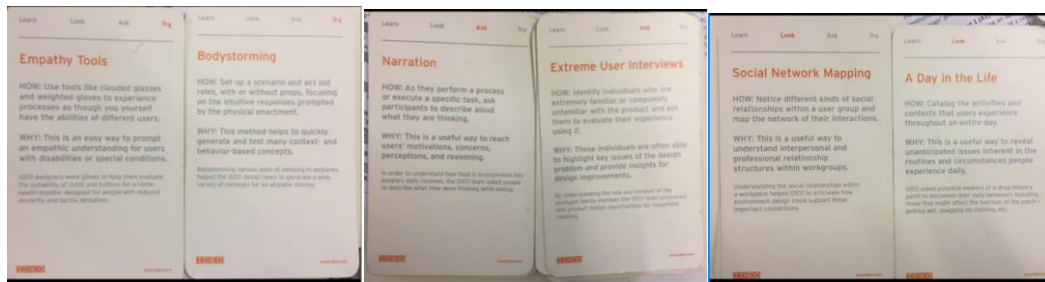

IDEO Cards

Which helped myself to gain certain information and not to offend anyone as the data was kept confidential and to gain some inspiration of ideas

with the three member which I managed to gain information through with the selected activities IDEO cards that in a group of four we as a group had decided upon to split up and go to different types of gaining research which many of us had different methods of gaining the information this was to go see people of the public or family member and whether to literally physically going to events, a day in the life with a family member, character profiling from questionnaires worldwide and interview over the phone and go use them in the field of my research which they were

a day in the life / social network mapping

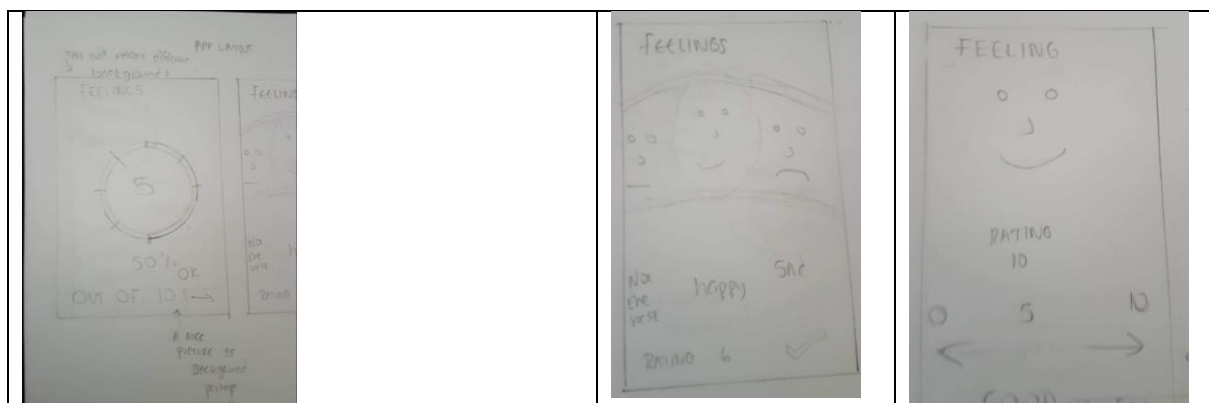

Empathy tools/ Body storming Narration/ Extreme user interviews

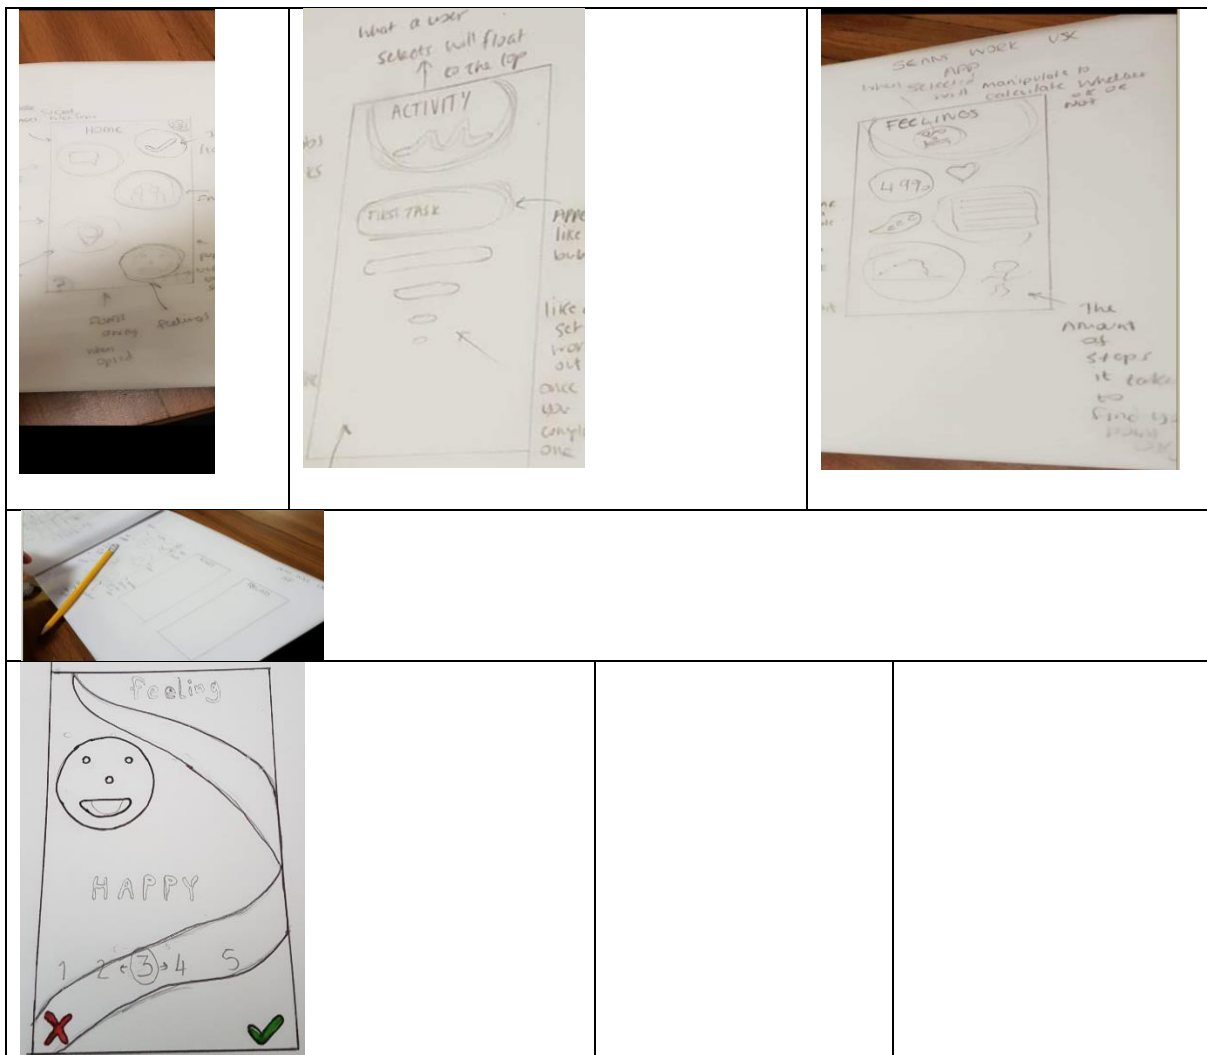

the concern with these card when as a group decided upon which to look at that for the three cards we had to decide they were pretty much similar of the same physical specific t view as the other card however we had decided upon a day in the life extreme user interviews and empathy tools

When trying to think of an idea of what I was going to design at first when looking through the designing with people website I was thinking something to help elderly people with electronic device who may not have much experience but when I gained the research to gather I found that this would be a more complex than I first thought. However then I thought ok I make it a software into which other family member who are looking after their elderly family could monitor them through an app through the family and so could discuss with other family member heir problems or if they are lonely then to see who available however again this would still be complex than I first thought because this would be involved monitoring 24/7 and so certain people for privacy reasons may not want to which I understand and so I still need to think about a total other idea as I found myself thinking to is way bizarre for one simple thing to a whole network of an idea at first

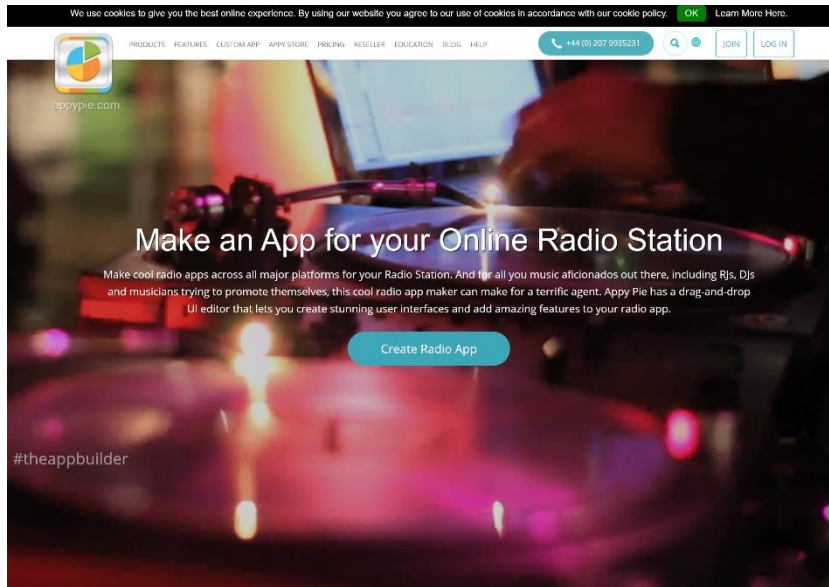

initial ideas

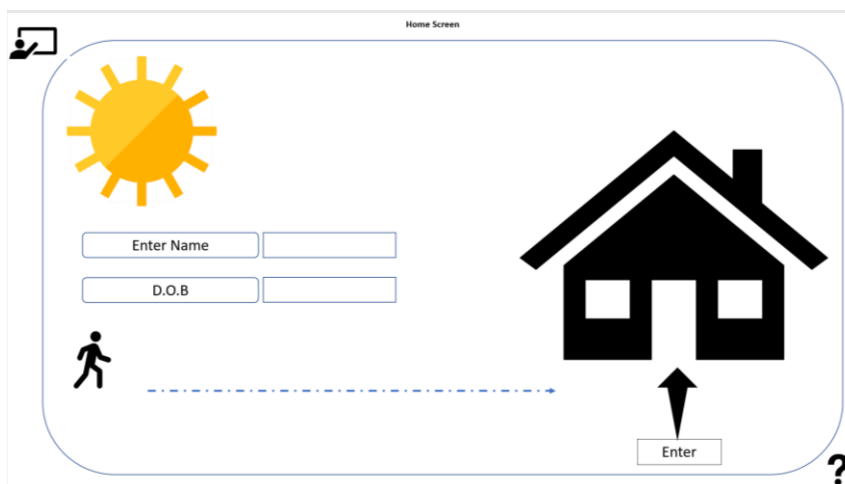

App Ideation From initial drawing and research

This is then where I decided on moods for an app as its quite fascinating how quick many people's mood changes and it always goes as follows watch what you say? And so although how quick peoples mood change but also when people look at certain things in their life which they wish they were back there such as memories or photographs but also it could be if the person is on their phone for long periods of time that before they do anything they have to fill in to log their moods again another thing is being in another world as I find people who are linked to social media they ignore you until they feel they want to answer you also that because people are more interest in their social life it may cause them to stay up whilst in the night making them become more tired and eyes will feel drained and there are more concerns of technology and what it may be doing to your health in which this app will monitor the timing of how long your device stays on and how much sleep the users having and will pop up or alert you to have a break

App idea 1

Feedback

The feedback I received for this one really confused me however in the end I did feel that I overthought this idea and that the idea could be possible but as our project was something little I did overthink it and so I found myself through stumbling upon what idea it could do next

App Idea 2

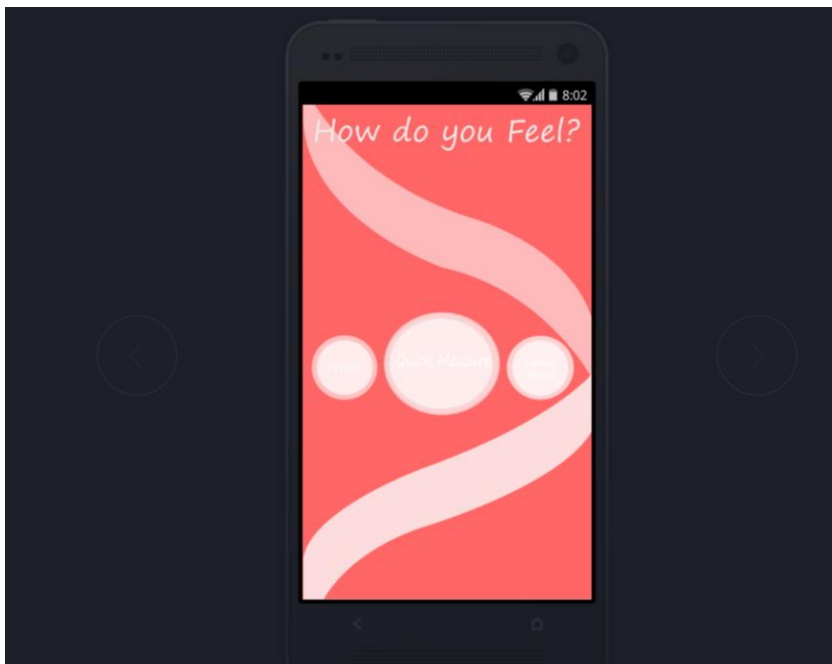

[Click here \(To preview Concept\)](#)

Feedback

for this app after discussing throughout progression support I found out still I was overthinking too much for what I needed to do as I did have an idea however it was not quite clear enough

App Idea 3

[Click here \(To preview Concept\)](#)

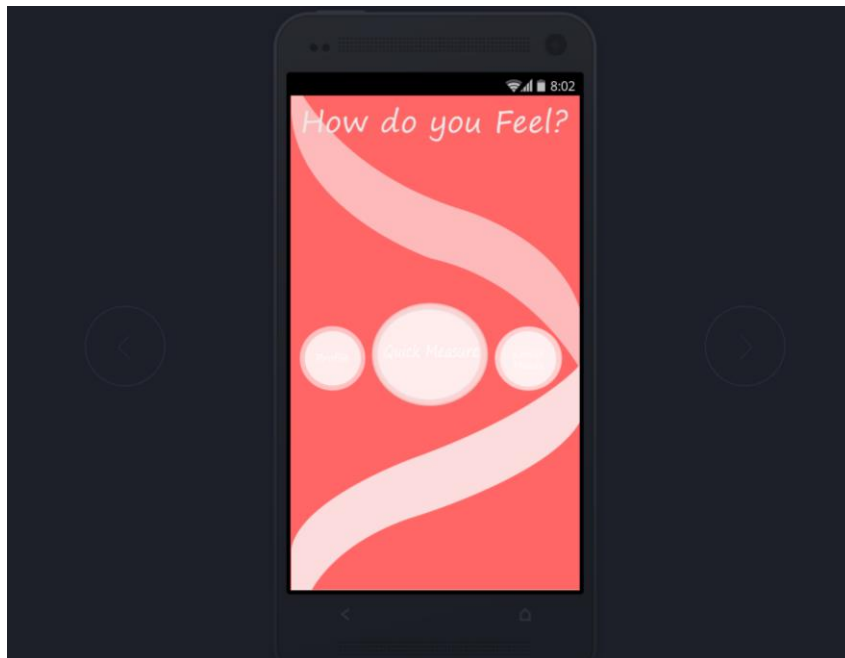

[Click here to view functioning concept](#)

Feedback

For this app I think I had the idea there it was just the layout I was experiencing more I was thankful I found some website app developer in which I could my work into to make the aesthetic of it look like an app on a phone this was the second one I sued which was called in vision however the layout and

what I can do within the developing package need to be explored more as I felt it didn't seem to help much other than a specialist at the side of the screen with annoying alerts and so I didn't feel for what I was working in however I have tried to explore more with my photoshop and illustrator skills in which I came up with this.

App Idea 4

[Click here to view functioning concept](#)

Feedback

For this app in the end as I was focusing on moods of people I made one more app concept in which I think is simple however I still think there something missing although with this concept all there is a variation of app face and mood type in which the user could be best described as also thinking about a make your feeling face where the user will make there sketch of their face however apart from that as people are more happier looking at memoires of old photos of things they find out in the house of on social media I think a gallery of picture need to be attached in way that the app allows to monitor you're the users feeling throughout the period of time that a user in within use of any particular device.

My Three app concepts and why I have designed them what took to m y inspiration and what the feedback was of them, each

For the design of the app I had looked at many different apps whether this may have been fitness apps lifestyle apps as I hadnt got an ideas until it was modds and so I wanted to create an app which was vibrant I colour however that was very minimal and so to pick colours which would clash but give an app that look so thwe App isnt desaigned around just one colour hiowever like facebookj twitter which is blue chsoosing colours was quite difficult also and this is why I looked into coolour schemes in which tell youu a lot about different colours and how they work and also to dow ith shiop[scenarios and how you walk int shops and buyb manyh of certain things it the way the ir position and so in a way design the app so it looks interesting and to see where the inspiration has come from.

Colour scheme and reasoning of these colours

[Click here \(To see preview\)](#)

With some of the existing apps and concepts the design idea of the way it aesthetically looks to the same shade of colour in which isn't too bright or clashing which helps with many people eye sights for when they use the app to crest a log of their moods

Some existent apps and concepts which inspired me to design apps the way I had and also important of all what comments conversations and opinions I had found out about apps and with device my family current find difficult of is that the layout of these apps are to big the colour is to bright doesn't help with brightness or the way I use the apps (What I found out with conversations and opinion of apps)

The reason why I had only three main member of family which I had looked into was due to the wrong time of day and also that I would have been able to go around all my family in a way and organised it that I see them all after another I experienced this when n a I went to take picture and gather all the necessary information I had to due to the app and obviously my family member would all been doing their daily task and this is why some of them went there or were hard to get in contact with or even find. however, whilst doing the field work it was an enjoyable day out in which I was free and to keep some of my family member company with one to one conversation face to face or through social apps to get hold of them.

As for the research that I had carried out which at first, we were in groups to get started we all had to decide upon certain questions which made sense to people who were going to send them to and that the questionnaire was easy to follow and not to involving with their life of privacy and that they didn't become offended or leave any question unanswered of what we as a group were to find out

First questionnaire draft

The image shows a web-based questionnaire interface. At the top, there is a purple header bar with the word 'Questionnaire' on the left and icons for chat, eye, and settings on the right. Below the header, a white bar contains the tabs 'QUESTIONS' and 'RESPONSES', with '2' next to 'RESPONSES'. The main content area is white and titled 'Digital Communications'. Below the title is a subtitle: 'To find out research about digital communications with people through extreme user interviews'. The form contains four questions: 'Participants name' (long answer text), 'Age' (short answer text, marked with a red asterisk), 'Relation' (short answer text, marked with a red asterisk), and 'Gender' (short answer text). On the right side of the form, there is a vertical toolbar with icons for adding questions, text, images, video, and a list icon.

Feedback

When presenting the work of our questionnaire and finding and going through the work to see if the questions were acceptable to what we needed to find out some of the questions were repetitive and for a user which maybe elderly this may confuse them a lot as they could be thinking why am I doing this I have already done that question get stressed and even leave the question unanswered so in all ways as a group starting off to get information about the focus group we have specified and as we need to find out research the questionnaire needed to be clear of what we were finding out also that people were willing for their information to be passed on but kept confidentially and that It wasn't too awkward in some cases. This is the questionnaire I had followed with gaining my information however I believed I needed to do another one as I have changed my idea to a mood app and so need to think relatively of what information I will need to gain.

second questionnaire final

The image shows a Google Forms questionnaire titled "A change In moods". The form is set against a purple header and light purple sidebars. The main content area is white. At the top, the title "A change In moods" is in bold black font. Below it, a subtitle reads: "To find out research about people mood change whilst using their electronic devices and how it affects them". A red asterisk indicates a required section. The first question is "Participants Name *", followed by a text input field with the placeholder "Your answer". The second question is "Age *", also followed by a text input field with the placeholder "Your answer". The third question is "Do you own a mobile phone ? *", with two radio button options: "yes" and "no". The fourth question is "how many time do you pick up your phone ? *", with two radio button options: "Alot" and "when i can be bothered".

A change In moods

To find out research about people mood change whilst using their electronic devices and how it affects them

* Required

Participants Name *

Your answer

Age *

Your answer

Do you own a mobile phone ? *

☐ yes

☐ no

how many time do you pick up your phone ? *

☐ Alot

☐ when i can be bothered

With my second questionnaire I feel that I have found quite a lot of information but after learning from the first draft that I have took away a lot of the unnecessary questions which I had made in the following and tried to make the questionnaire as simple as possible for users to enter valid information and which is relevant also to make sure to include a comment at the bottom of the questionnaire of which the information obtain is to be enclosed and confidential as I find many people won't share information due to that and that it's only a small project which I need certain research for.

Here were some of the comments which I had received from my second questionnaire

My Drive - Google Drive x A change in moods - Go x change in moodsd Stats x What is a report? x REPORT EXAMPLE - Go x

A change in moods

QUESTIONS RESPONSES 13

If yes to all three previous question what do you notice ?

13 responses

My mood isn't dictated by my phone usage.

I use my phone usually when I am bored or need ideas for my class projects. I guess it's kinda like a security blanket

Na

If Im on my phone for awhile it can become boring I'm only ever on for few minutes if I'm watching videos I'm enjoying it if im trying to sleep nd people calling texting it annoys me

-

I get rather aroused 😊

I'm very ignorant

Nothing

Phones effect everyone's lives

What's on the phone can drive the overall emotion

2 responses

No worries

ok thanks 😊
