

Artificial Intelligence (AI) in Academia

I think AI is beneficial for students. I think the impact of AI for students is that it helps be honest. AI can help students be honest by helping detect when they cheat. AI can help students be honest by detecting when they cheat easily. AI programs make it easy for lectures to see whether one student has completed their work by copying someone else's work. Software like these let students know that cheating is wrong and compel such a student to work on their own. AI can also assist in learning more, motivating them to work. There are software who pushes a student to work on themselves and not cheat. Those types of programs Aids in assisting a student with difficult subjects. Accredited programs which you can find online provide valuable information which can help you, the student, to study better. It seems to me that students who understand concepts easily are less likely to cheat because a person like that has confidence in his or her own abilities. Artificial intelligence can even help teachers in the sense that it makes teachers aware of their students' understanding in class. Teachers can use AI to understand if their student doesn't get something in that subject. In this way, teachers can help these students more before these students feel the need to cheat or leave school. Negative Impact of AI in University, AI is helpful but it is also a problem statement. Some students use software that takes advantage of artificial intelligence (AI) to cheat right now. They get clever programs to generate essays for them. These programs help students finish up work that is not their own. Students don't develop researching and problem-solving skills due to such programs. Many students do not possess a complete understanding of the repercussions of cheating using AI. Many students have no idea what really happens when they use AI to cheat. If students get used to taking shortcut they would forget that honesty an honest effort required. Their own. Also, you are missing on skills like problems solving and critical thinking if you rely too much on AI. They don't develop these skills if all the assignments are done by AI. developing these skills.

University need to strike a balance in the usage of AI. For students to use AI easily without facing any issue, there has to be clear guidelines in the use of AI. Teachers must instruct students on acceptable and unacceptable use of AI. Teaching students AI ethics is possible so there is an understanding of when to use AI and when not to use AI. AI can help students work together in schools (13 words). For example, having students use AI to create fun learning activities that require group work would be a great idea. This would let students let learn together and it would not be as tempting to cheat. Conclusion Overall I believe that AI is both positive and negative when it comes to academic integrity. AI can be utilised to aid learning and to aid in not cheating, but it can also lead to shortcuts being taken and in no

longer needing to think. In order to use AI in a useful manner to learning, school needs to instruct students to use it appropriately. As soon as students use AI appropriately, they can learn new material without dishonesty.
