

Important and essential skills for academic study

Collaborative study is an essential skill and can benefit you more than you know. It is used a lot in academic study and can allow an individual to express themselves in a group setting. It is said by Cottrell (2019) "students in strongly bonded groups tend to do better". Developing your collaborative skills are essential and vital as you will use it in all stages of life. You could be at a future job and required to complete tasks that require team-work and group discussions this is a good skill to have as an individual to an employer.

Time management skills are important when it comes to academic study. You should be able to balance out your study time with your daily life. It's not always easy but if you organize your time correctly you could plan and achieve plenty of ways to both study and have fun. Cottrell (2019) says, "The more time you put into various tasks of reading and thinking about your subject, preparing for exams or fine-tuning your assignments, the more likely it is you will do well".

Research is important in our lives whether you notice it or do not but you mostly research every day without knowing. You could be checking for the local routes to places, bus times or even menus of restaurants. It is believed by Cottrell (2019) that research is important and that "You learn to work with information and make it meaningful in the context of your course and assignments". However academic research is a whole different ball game. Academic research allows you to express knowledge of things through research rather than your own opinion
