

SITE SUPERVISOR

Brian Gaspar – Task 2

10/08/22

My Presentation:

Today I'll be talking & presenting to the class about my future role in the construction industry. We will be going through the duties, skills, knowledge & much more about being a site supervisor in a construction site.

Roles & Duties

In a construction site, supervisors are often foremans who direct other workers. They also ensure to envoy a duty that needs to be done before it's due date. They also make sure that health & safety, permits, deliveries & other key factors are organised & placed on site.

This role is also similar to being a site manager, just that being a supervisor you're more aware & around the site, so you know more about what's actually happening in all departments. A site manager doesn't explore or take in as much as the supervisor does, they focus more on costs, meetings & deadlines.

Strengths & weaknesses

Strengths

I work in the construction already as a labourer, so I'm very familiarised by the industry & how it's programmed. So with my experience in site I know a lot about what a supervisor does to my knowledge. My other strength towards this role would be that I have great communication skills & leadership, these are very useful when being a supervisor because majority of the time you would need to regulate workers & work being laid out.

Weakness

Being involved with I.T/compute ting is a weakness to me because I'm used to being physical & doing on hand jobs. A supervisor also has to gather intel & send them through or keep data in their computer system. Another weakness of mine would have to be punctuality, I'd do everything at a good time apart from attending to a place at its accurate time. Supervisors have to reach their site & open it up majority of the time to allow everyone else in.

Opportunities & threats

Opportunities

The perks that I've got is that I'm already in the field & a step closer. With the work experience & skills that I've obtained from just being a labourer means I know the ins & outs of a constructions site. I've also got a CSCS card & NVQ that allows me to have access to any site (that I have world given from). If I network with site supervisors I come across in any site they also may be able to help me & lead me to this position.

Threats

My threat would be time management. Reaching to work bright & early, making sure everyone in all sectors get all their task on time, picking the right days & time for deliveries to reach and more. How I would overcome this is by setting a scheduled alarm on my device for all upcoming events, and for any personal purposes such as waking up early & getting the habit of it. Another threat would be to having to get the qualifications for it. I'd have to sit a course, test or university to gain the skills for it, which means more time, money & energy will have to come to place.

Personal Planning

2 years ago I qualified as a workman and I've been doing it till now. I've achieved it by doing a 6 week course studying & doing practicals. I had to follow a few tasks, write down the informations I need & start the work. I done a few skilled labour activities such as paint & decorating, plumbing, bricklayer & few other skills. My interest that made me get into the construction industry was because I like active jobs that make me work, especially if the pay is good, I also like the experience of being part of making new builds. Before being on sites I used to work on the tracks fixing rails, so the inspiration also came from there. So with all of the skills, knowledge & experiences that I have obtained, it would help me to push myself so I can elevate & climb my way up to be a site supervisor.

Time Management

To become a site supervisor I would need to be precise & coordinated with my time. The first & most important thing is making sure i have a good night sleep. This helps waking up heathy, fit & on time for work. Not going to bed early & well can effect me in the morning, these are mostly caused by distractions, being on my phone or game, going out or even eating. I should allow at least 30 minuets of my time to get ready for work, you would be able to have breakfast, freshen up & other importances on time.

During work is when you have different time schedules to process, one of them is taking breaks on time & making sure you eat or rest at a goo pace. Anything reason for time management being effect at work is gathering intel & data about every other trades about their work right. Deliveries & meetings both also need a great time management because these are important calls that have greater impact to the construction site.

The time you have between work & bedtime are times you have to yourself. Make sure you get every that needs to be done sorted. You get to relax sooner & have a comfortable night to get ready for the morning. Having 7 to 9 hour sleep is necessary if you want a good night sleep, also eating & relaxing or doing your hobbies before bed helps too.

Summarise

We have talked about me & my future Career as a site supervisor. We established that I need to get qualifications to get the role, along with my weaknesses & opportunities I should be able to develop them to better myself. My time management should be improved so that I have a better working schedule in my day to day life. My experiences are pretty high so I'll manage very well for when I do get the role. I also hope to get a great understanding of the course/education.
