

Digital Skills and Research Methods

Student : Kapo Celestin Dagrou

Student ID : 2019681

Group : 8

Introduction

The pandemic that the entire world is experiencing has caused all-out movements with uncontrollable loss of life. This confused situation is creating panics across all continents. Thus, the educational authorities of the United Kingdom have created the conditions to allow all students to continue the lessons and specially to avoid the propensity of the disease.

Here are few reasons that have favoured the creation of virtual learning.

What can we say about this system which, every day, allows young people and adults to be connected from home. Great idea.

The progress of technology is having its effects.

The internet, which makes everything possible, arranging a taxi from your phone, banking transactions without going anywhere; orders clothing, purchases, and rent whatever we want. Just a bank card and the internet does the rest.

A few years ago, who would have believed. Today we are in the real world. Technology seems to be above it all.

For us who work and attend the courses, this is a great opportunity. Virtual learning allows us to follow both occupations with great interest.

Time management is also better organized. Distance learning brings us all closer to classmates even at home. The university platform called (Moodle) is very effective because it makes our various researches easier.

The internet that drives and solidifies virtual learning also has its consequences. During orders, purchases, all you must do is to enter a number wrong and everything is blocked; as to when to transfer money, the money will go to an unwanted account. You can also be in trouble if the internet goes down.

Conclusion

The good progress of technology is a great victory for scientists who allow us to cross levels of development.

But beware because science has its setbacks.
