

Sharing participants' content can mean directly with other participants, or with the whole cohort in a session.

Core Enhancing Technology

Key Enhancements

- **Peer assessment** — both the content creator and their peers benefit. The creator receives feedback, and peers must focus upon success criteria in assessing material.
- **Collaboration** — facilitates working on joint projects by sharing access to files.
- **Exemplification** — collectively identify good practice or correct misconceptions.

Teaching and Learning Ideas

- Encouraging students to share documents, presentations, spreadsheets, notebooks etc. using Office 365 applications such as Word, Excel and OneNote together with OneDrive allows students to work on joint projects without the version confusion often created by e-mailing attachments back and forth. This also helps develop and improve student digital literacy in relation to personal digital asset management.
- Sharing student content which demonstrates an effective technique and/or an innovative idea is reinforcement of that individual's practice, a confidence boost and inspirational to the cohort as a whole.
- Where there is a common misconception or a student has reached an impasse with a task, sharing the work with the cohort thus far can allow the group to solve the problem collectively, allowing any misconceptions to be raised and addressed and providing a deeper understanding of the solution and its principles. However, this should be done sensitively through anonymity or by creating a culture of valuing mistakes and misconceptions as learning opportunities rather than failure.
- Sharing content from student devices enriches feedback from in-class tasks by allowing written answers, research findings etc. to be shared via the main display, captured using the snapshot function and then shared via Moodle for example.

Try Also...

Other productivity suites such as Google and Evernote include cloud-based sharing of content among users.
