Assignment 1 - Data Management - Luke Evans

GRADEMARK REPORT

FINAL GRADE

60/100

GENERAL COMMENTS

Instructor

Suitable report layout demonstrating an understanding of the theory behind it to relationship diagrams. Present a very comprehensive list and normalised datasets. However do not prove its correctness by using test data.

You work through this well to suggest suitable tables and suggested the normal forms but again to reiterate no test data.

You have however made a good attempt at using determinative diagrams. Did this reduce the number of table that are perhaps required to solve this problem?

In your entity relationship diagram you have an extensive number of tables for example you have a table that just links to the customer age and could it cause data duplication.

You also have an admissions table and a membership table are they not the same, is looking at their contents and attributes they seem to contain the same information.

When you are normalising your data if you had put in test data this might have highlighted the fact that some tables are causing data duplication.

Generally your report has very good layout and you have analysed and produced some of the appropriate tables for the solution.
