The module title: Business Skills BMIH4001

Lecturer's name: Lan Zhang

Wordcount: 400

Legal Issues – Fire Safety in the Hotel Industry

Fire safety is very crucial and significant in the hotel industry since a significant number of employees and guests stay and work in the buildings (Smith, 2017). To protect the life of workers and guests, the hotel industry must abide by the rules and restrictions of fire safety (Jones, 2018). The company that operates business in this sector can take some measures to ensure fire safety such as installation of smoke detectors, and fire alarms, implementation of plans for fire evacuation and use of fire suppression systems (Williams, 2019)

The installation of fire alarms and smoke detectors is one of the key elements of fire safety in the hotel industry (Brown, 2020). These safety measures are specially designed to detect fire and smoke and playing sirens can easily alert guests and employees immediately in case of fire incidents (Jones, 2018). Only the installation of these measures is not enough, regular checking and maintenance of the systems are also necessary to make sure the smooth function of these measures (Smith, 2017). Additionally, clear signage and instruction must be written or provided by poster or leaflet so that the guests and employees can easily understand what the signs and signals mean and what they should do if there are any fire incidents (Brown, 2020).

The establishment of fire suppression systems is another significant aspect of fire safety in the hotel industry (Williams, 2019). These systems can automatically extinguish the fire quickly to minimize the damage and risk of spreading fire (Jones, 2018). As a legal requirement, every company that operates in the industry must set up various systems for fire suppression i.e. fire extinguishers, sprinkler systems, fire hoses etc. covering the building area (Brown, 2020). Apart from this, the firm should provide the employees with proper training about how to use these systems in case of fire incidents (Smith, 2017).

Fire evacuation strategies limit fire damage (Jones, 2018). These plans detail how staff and visitors should evacuate the facility in event of a fire (Williams, 2019). Companies must have a simple fire evacuation strategy by law (Brown, 2019). In addition, the company should provide events to educate visitors and staff about fire evacuation preparations (Smith, 2017).

In conclusion, hotel companies must provide fire safety, making fire safety a legal concern. Firms may install smoke and fire detectors, use fire evacuation systems, and create and execute fire evacuation plans to meet these regulatory obligations (Smith, 2017). These steps may help hotel companies protect guests and workers against fires and reduce damage (Jones, 2018). Check and maintain these systems for improved fire safety measurement results.
