

BASIC DIGITAL SAFETY

how to be safe in digital world

in the world that we living all five fingers are not the same. in one hand there are good people that only mind their own business and working on improving themselves. but, in other hand there are group of criminals that only focus how to destroy others and get some kind of income through doing bad to people they could potentially cause a lot of damage. They could steal our money, commit fraud in our name, or even use our personal information for identity theft.

A.

keep your login details safe. you should never share your accounts login details with someone. because if they login to your account they would have access to all your personal chats and personal information of you and your beloved ones.

B.

never save your login details to public computers or someone else's device. by this the next person who using that device easily can login to your account and get access to your privacy.

C.

choose a strong password. strong passwords provide a barrier against hackers and cybercriminals. if we use a weak password, it will be easier for them to guess or crack it

WHAT IS A STRONG PASSWORD:

1. the longer the password is, the more difficult it is to guess or crack. Aim for a password that is at least 12 characters long.
2. using a mix of lower and upper case letters
3. using more numbers and special characters
4. avoid using common passwords or personal information as part of your password. Hackers often have lists of common passwords that they will try, so it's important to use something unique and special.

D.

make your account private and only add those who you know. don't add or accept friend requests from unfamiliar people.

E.

Don't meet people who you get friended through internet. if they ask you for a meeting never accept that and keep your friendship online only.

F.

before going to any website think with yourself is this trustable? and if you open any link and they ask for your personal information to use their website never give them those things it might be trap.

G.

do not trust all the information that you read online unless you check their references. people share their own opinions and making fake references to some trustable organisation, always remember to check their references before believing it and share it with others.
