

Nature Scope and Impact of the Problem in the Energy Sector

Crinela Covaci

2123254

Nature of the energy sector

- Apart from greenhouse gas emissions, the energy sector releases pollution into the air, water, and soil that negatively impacts human health.
- Oil, gas, and electricity prices skyrocketed in 2022 due to shortages and price increased which was caused by the Russian's war with Ukraine and COVID-19 pandemic in 2021 which we can see in the 5 whys diagram.

Scope of the energy sector

- Lower-income households are more affected by rising energy prices than those on higher incomes as the cost of living rises across Great Britain.
- While countries worldwide are committed to reducing their carbon emissions and investing in renewable energy, it is not yet available in sufficient guaranteed quantities to remove the need for fossil fuels.

Impact of the energy sector

- Those who were affected by the energy sector their cost of living increased in the past month, rising energy prices are a growing factor in the squeeze on household budgets
- The energy sector, which entails the construction of infrastructures like electricity grids, or wind farms, **can receive a negative reception from stakeholders within the community**, and if these stakeholders are not adequately managed, the project as a whole might not be successful.
