

In this essay it will look how it is very difficult to balance the economy, social and how crucial the environment is with a modern world. It will also look at policy, legislation and how these two systems work in everyday life. This essay will mostly be looking at the United Kingdom. It will also look at sustainable development in the aspect of daily living such as the fuel poverty within the main body of this essay will compare and contrast two sustainable theory's such as eco socialist and eco feminist and how they relate to the given assign brief. It will also contain a conclusion at the end of the essay.

Within the theory of sustainability development there is a strong theory of the three spheres of sustainability. They include the environment, social and the economic environment. These are all vital for society to work in a cohesion with each other.

Sustainable communities are communities where a collective of people want to live and work. Within the current time and within the future. They meet the need to meet their diverse needs of existing within the current world and environment and within the future, they must look after the environment and add to a high value of life. They must be safe within a well-built home, and have equality of opportunity of outcome for any opportunities for everyone who will be part of that society (Thiele, L.P., 2013).

The environmental pillar includes the natural resources that are required to make such items as phones in which are made within countries who have cheaper labour and less environmental rights and human rights. Such as with the metal that comes from Uganda then it is imported to other countries (The Guardian,2016).

Also with the natural resources will include soil health, deforestation, carbon footprint and its impact to the climate change, in which there is a strong evidence that mankind have increased it to a dramatic level but there is also apposing arguments to climate change, how we dispose of our wate such as less main rubbish and more recycled rubbish, power such as coal, natural gas or a green approach such as solar, wind or geothermal (Earth day, No date).

Within the United Kingdom has started to make the change to the way we use power in the aspect of powering our houses, heating our homes and the government is aiming to reduce the United Kingdom's carbon footprint by twenty thirty five, there aim is to have the vest of the public driving electric vehicles. Rather than petrol and diesel. Also, they will be encouraging people to walk or cycle. To contradict the government will they have the infrastructure to cope will the amount of people moving to electrical vehicles and can the workers of the United Kingdom afford it(BBC News, 2019).

One of the challenges when it comes to the environmental pillar is that, within any business impact will often not be fully exposed and broken down. This will mean that there are externalities that aren't being recorded such as carbon dioxide, land reclamation and hazardous waste or general waste. The social pillar will include transport such as trains and buses that help and serve the community. There is also education, health, nutritional food, recreation, employment and housing. Within the social pillar will link into inadequately concept such as the social license. This will mean that businesses who are aiming to be sustainable should have the support and approval of its workers and within the community it will operate in. The methods to securing and retaining this support from the workers and the community can vary, but it overall come down to looking and caring for the workers of the businesses and being a positive part the community (Thiele,P,L.2016).

The economic pillar of sustainability is where the majority of businesses feel they are on solid ground. For them to be sustainable, a business must be making a profit. To oppose this, it can be said that. A business cannot overrule the two other pillars within this theory. Within the theory a business making a Profit is not what the economic pillar is about. This pillar will look at governing a country the correct way and risk managing. Occasionally, this pillar can be known as the governance pillar,

this will be referring to a positive corporate governance. The impact of sustainability can be more cost effective in such areas as food production in which can then lead to a higher inflation price for items. But also, some businesses are attempting to do this in such shops as Iceland who cater to the lower and middle class of society. They have introduced cardboard instead of using plastic raps for some of these items. The issues with sustainability is that people can often get into a rhythm of living and who struggle to adapt in daily life (Higgins,K. 2014) (Iceland, No date).

Society environment relationships the theory itself will suggests that anything that encompasses our environment of the natural world as the things in which though separate us alter our life or any activity in certain way. It can involve of all the things that can surround us and it can influence, the present whenever an occasion arises. It implies to those forces or situations that will affect the environment from outdoors. The environment is not as straightforward but an increasingly complex and consists of different forms. Such as the natural environment, biological social and the supra-social environment. The natural ecosystem can contain the geographical, climatic and the overwhelming controlled of the geographical atmosphere and ecosystem. The natural environment will be made up of different plants, animals, humankind and many more. The social ecosystem has three different kinds of environments such as economic, cultural and

psychosocial. There is also the supra-social environment that will involve the religion and the supernatural (Nandagopal, R., 2018).

Unemployment can have a direct link to a country becoming more sustainability this is because the initial price will be high also within the United Kingdom has a welfare system known as universal credit. In which is only three hundred and forty-two pound and seventy-two pence for a person under twenty-five. And four hundred and nine pound and eighty-nine pence for someone who is over twenty-five. The person who receives this payment will struggle to afford the basic of needs in which is stated in the hierarchy of needs theory. This has been shown in twenty twenty in which families have struggled to feed their children, in which this has had its impact on food banks and local business to help and feed them. This has led to a rise of more waste and less of a sustainable future within the United Kingdom (Pepper, D., 1993) (Gov.UK. No date)

fuel poverty within Wales is stated that if a household spends ten percent or higher to heat their home. Or on any other energy, Mortgage Interest and Income Support they will be classed as being in the fuel poverty bracket. It is stated that households who have a low income will be find it very difficult to heat their homes.

If a person finds it hard to heat their home will tend to be on a low incomes in such employment roles as a support worker and cleaner it is also stated and a person who is classed as vulnerable can also struggle with heating or powering there home. The most recent of statics on the people who are currently living in poverty are two hundred and ninety-one thousand homes are living in fuel poverty. Within Wales twenty eighteen one hundred fifty-five thousand homes were at the time residing in fuel poverty. This is equal to twelve percent of all homes within Wales. It was stated that privet rented properties will tend to be fuel poor by twenty percent. Fifty percent of people who live in fuel poverty are mostly likely to be a single person household who don't have children, also it is started that homes that are older will be more prone to be in the fuel poverty bracket (Kearns, Ade, 2019) (Statistics for wales, 2018).

Eco socialism binds together two complementary ways of thinking about human beings and the natural ecosystem they exist in. When it comes to the term eco in the theory of eco socialism will come from the school of science of the topic of ecology. It will strongly have an emphasis on the highly complex and dynamic connections amongst the living and non-alive world of the elements within an ecosystem. Ecologists recognize how the natural life functions within an ecosystem. It can be interrupted by the behaviours of one individual or organism. Ecology will not have a social analysis; it will have no means of understanding how the economic and political systems influence human behaviours and within the social changes. Eco socialism mixes the perceptions of ecology with the affluent belief of socialist theory such as Marxism (System change not climate change, No date.)

Marxist theory reveals that the ecological predicament is rooted in a harmful economic and political structure such as the opposing theory as capitalism. This offers a way of getting an insight on how the theory of capitalist system works, in such areas as envisioning positive structure away from capitalism theory, in which the means of production is driven by a shared benefits and means of human needs are met and shared out between the bourgeoisie and proletariat social classes within society. If you look at environmental natural disasters and

manmade disasters such as Chernobyl and the Manchuria flood that happened within China this reminds society on a meso scale that the difficulty of eliminating capitalism will not be enough (Struhl, Karsten J., 2020).

Eco feminism, or it is also known as ecological feminism, is a division of feminism that will explores the relationships between women and nature environment. The term Eco feminism was created by a historical feminist know as Françoise d'Eaubonne within nineteen seventy-four. Eco feminism will take the approach of the roots of feminist theory such as the equality between both genders known as male and female. An revaluating of the patriarchal or nonlinear social structures that take the perspective of the planet that recognizes the importance of the organic methods, holistic relationships between women and the environment (Moore, Niamh, 2008).

To these conceptions eco feminism combines an dedication to the natural environment and an understanding of the relationships that is made between women and the natural environment. In Particular, this theory will highlights the ways that both the nature environment and women are treated by patriarchal society by their male counterparts within society. Eco feminists investigates the impact of gender classifications in order to show the ways in which social patterns apply absolute

control over women and the natural environment. The social theory of Eco feminists also asserts that those social normalities will lead to an incomplete viewpoint of the macro world. It will be the practitioners advocate an other worldview that the positive values the natural environment is as sacred, from humans dependency on the natural environment, and will need to embraces all life as valuable (Britannica, No date)

If you compare Eco feminists and Eco socialism they both have some of the same points such as how important the natural world is in order for human beings to survive in order for their own different viewpoints, within society and within the natural environment to survive. They also share the same belief that people should get fair and equal treatment within employment and within society and within the mistreatment of the natural world. The difference between these different theories is that one of them is actually taken place in within the modern world within twenty twenty in the case of the eco feminist theory, in the example of they way women are being respect within society such as the United Kingdom. Having two female prime minsters and also within the me too movement. There is also changes that are happing in the way the modern world view the natural world by countries recycling and attempting to reduce their carbon footprint, this is not to say that eco feminism have achieved this

but from the evidence you can see that they are making small steps towards this goal (BBC News, 2019).

In the case of eco socialism and the impacted that they have made to compare this to eco feminist theory. Is that eco socialism has shown how the most exploited workers and exploited the materials that we use every day has been exploited. In such countries as Vietnam, India, China and also within the western world as within the United Kingdom, where the vast of people who work are struggling to pay they living expenses this could be because of a tory government that has tax the workers and made the poorest within our country an example of this is low paid hourly wage, tax and a poor example of a welfare policy(Climate & Capitalism, 2013).

This has been shown by the latest evidence of the current crises know as the corona vires where MP have declined feeding children who have free school meals in school, when school is off because of this vires. But instead gave themselves a three thousand pay rise and also damaged the most vulnerable within our society. From this eco socialism has failed in part of there theory (The Guardian, 2020).

To conclusion that the needs of the economy, society and the environment is incredibly complex. And that it is requires a mixture of different theories to solve, but it can be solved by having an open mind and a positive approach to fairness with the lowest paid in our society and within the government to be honest. To the people they are supposed to represent in parliament. But also, that to save our environment we all need to take responsibility for our own climate change and how we all save our world. From the evidence from the body of the text you can see that within the United Kingdom is making an attempt to solve the balance of the needs for a society to be a successful Society. In some aspect of the policy, legislation and within the practice. Such as the future of generation act twenty fifteen. But this is a start, but we could all do a lot more.
