Basic digital safety.

Following our necessary tips about internet safety you can avoid the dangers of the internet.

To avoid cyberattacks when you are online you need to :

1. Use a secure i nternet conection.

Public Wi-fi conection is not recomanded because you dont have direct control over its securiti.You can use Wi-fi conection protect by VPN when you use youre personal detales.

2.Use a strong password.

To have a strong passord you need touse more then 12 diferent characters. Use youre date of birth,a pet name or a sequetial number("1234")is not a good ideeaa because you use thi date alredy in online.

3. Enable multi-factor authentication .

Where is posible its a great idea to introduce multifactor authentication .For youre securiti instead to use onli youre username and password you can add:

- A extra one-time password that the website's authentication servers send to the user's phone or email address.
- Answers to personal security questions.
- A fingerprint or other biometric information, such as voice or face recognition.

4. Keep software and operating systems updated.

If you whant to use the best securiti patches you need to use the las version of youre software and last version of youre apps.
