

Building a Secure Home Networks

Created by: Adam Abdullah, Student p number: P145984
Student Email: aabdullah.145984@student.uwtsd.ac.uk School of Applied Computing, Faculty of Architecture, Computing and Engineering. University of Wales Trinity Saint David, Mount Pleasant, Swansea SA1 6ED.

1. Introduction

Nowadays, there are many devices and home user need to be educated to use networks. In the past must people share a computer to use a limited resource. The purpose is to plan and provides a clear understand of direction will measure the success of process.

5. Risks

Security vulnerabilities and treats need to be addressed to reduce the damage to the assets. This could be their data being lost, time of hours cost and equipment's. [5]Secure the wireless home networks.

2. Aims

- Provides a more secure home networks
- Discovering current security and integrates a better security features.
- Protect user information from hackers[1]

Figure 1

Figure 1, [6] is an example of Khali Linux software that used to manage the home network.

3. Objectives

- Simple and Easy of usability
- Maximised Protection
- Quality of equipment's
- Improved Networks
- Added Features

6. Conclusion

In conclusion, studying the current home network security will provide better ideas. This will allow to add better solutions to build a more secure home network. This is all about how to secure home data.

4. Resources

The author used number of resources to provides information on how to build a secure home network. Using specialist's software and hardware to reduce security issues. Software is protecting the network by scanning and testing to ensure it is secure from unauthorised access. The purpose is protect private and confidential information related to the user.
