

What caused UK's energy crisis?

Student name: Valentin Aurel Dobre

Student number: 2132087

Lecturer: Laura James

Nature.

The energy problem is the result of numerous, not just one, impacts on our natural resources. Overconsumption has put a demand on fossil resources including oil, gas, and coal.

Because of shortage of supply as nations started to recover from the pandemic, demand for gas started to rise once more, which resulted in higher gas prices.

Looking at future fossil fuel price in May, which have since increased in price, the IMF analysis evaluated the impact of the energy crisis predicted during the whole 2022 period. According to the study, higher energy costs will cause the typical UK household to lose 8.3% of its overall buying power in 2022.

SCOPE

those who are affected by the crisis are the external stakeholders (suppliers companies banks customers)

also the internal stakeholders such as (managers employers).

the problem has gone a long way because of the inflammation because of the covid, raw material producers have difficulty keeping up with what has caused the increase in world prices.

The biggest issue is oil and gas prices because prices have tripled since 2021. Gas remains a major issue for the UK energy mix so consumer prices have risen .

IMPACT .

the biggest problem in supermarkets is truck drivers, even carbon dioxide is causing problems in retail and hospitality. and that's why we people see empty supermarket shelves. Brexit has made the situation much worse for foreign workers in the food supply chain because those who did not have permission to work now can no longer have it. many pubs and restaurants are having a hard time staying open due to lack of staff now because so many have left. and to attract staff they have to raise salaries. Also, like truck drivers, they also have difficulties because gasoline has risen up and company bosses want them to work overtime for less money and that is why drivers do not want to work, therefore supermarkets, pubs and restaurants do not have food to sell .

Undiscovered Renewable Energy Choices: In the majority of nations, renewable energy sources are still underdeveloped. Coal is one of the main non-renewable energy sources. As a result, it continues to be the best option for producing energy.

Energy that is sustainable is defined as something that never runs out or is limitless, like the sun. Renewable energy sources are frequently included when the term "alternative energy" is used. It refers to energy sources that are different from the most prevalent non-sustainable sources.

How does reusable energy work?

Solar Energy

Among the most plentiful and readily available energy sources on our planet is sun exposure. The quantity of solar energy that reaches the surface of the globe in a single hour exceeds the planet's whole annual energy needs. The quantity of solar energy we can utilise varies depending on the time of day, the season of the year, as well as our geographic location, despite the fact that it may seem like the ideal renewable energy source.
