Death by Power Point

Introduction

In the next few slides we will be dicussing what we think is death by power point

1. No one reads and listens at once
2. Size matters
3. Contrast imaging
4. Dark backgrounds work better
5. Six things max on a scene at one time

By Hodo Awabdi

By Talitha Briggs

By Ericka green

By Shanae Hall

No one listens and reads at the same time

If you expect your audience to listen and read at the same time they will retain 0 or close to 0 amount of information

The purpose of a powerpoint presentation is to provide useful information that you as a presenter wants your audience to view, listen too and understand.

If theres to much information you will trigger what is called the redundancy affect, where as your audience takes away nothing and your presentation would have been a complete waste of time.

To avoid the redundancy affect you should keep the text in your powerpoint to a minimum.

clear headlines, with short sweet text, making your text direct and to the point.

Once you have done this you can go into greater depth and explain in fine detail your concepts verbally .

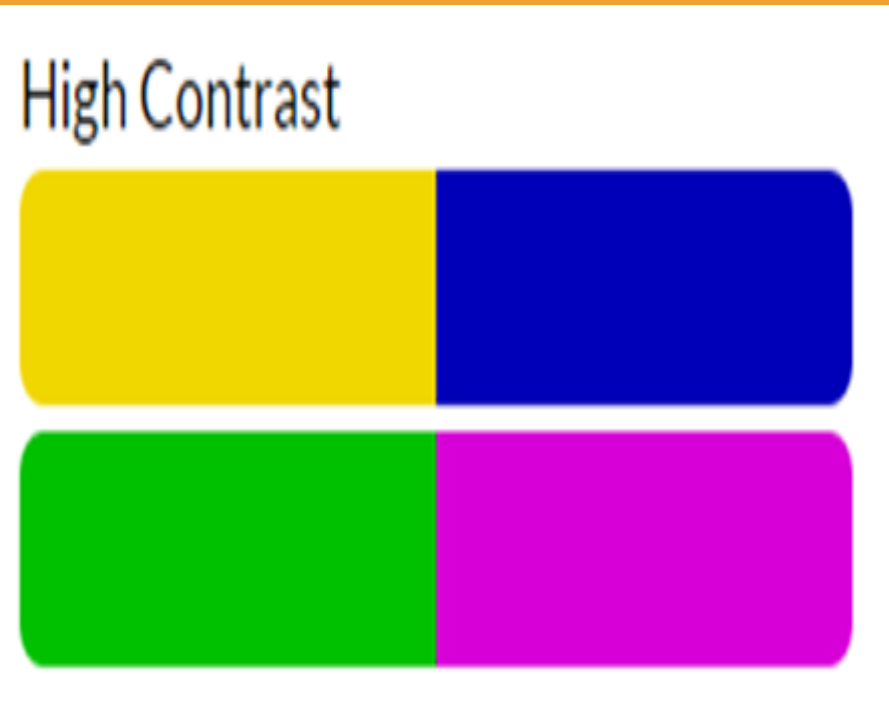

Size matters

- Does size matter ?
- What catches your eye in a power point
- Enhancement on a image
- Moving Objects
- Signaling colours
- Contrast
- Big objects

Contrast imaging

Eyes are drawn to things that have high contrast

Low contrast is white and greys so these colours are so close to one another

High contrast is black and yellow or red and white so their differences are very dramatic

Contrast is low when two colours are very similar when contrast is high the colours are very different humans focus on high contrast things first low contrast things second

Dark back Grounds Work Better

- Have dark Background .
- Why does a light back ground effect your powerpoint ?
- It can affect your eyees when reading it ona bright back ground whit bright colours
- Whats colours should you use
