

Artificial intelligence also known as AI.

What is AI? AI is a field of science concerned with building computers and machines that can reason, learn, and act in such a way that would normally require human intelligence.

AI can be a very controversial topic as there is a lot of pros and cons to this technology, some of the benefits AI generates by 100% facts and they don't add their own opinions to the problem like humans do, so you can trust in AI that it is 100% the truth. Another positive to this technology is it is an easy resource to access quickly when you're feeling lost, for example by just one simple click you can find out where and how you can get to your destination using Google Maps. There are also more benefits to AI such as helping young people find out more about themselves and what pathway they will choose on in life. AI is a fast reply to any question they might have on a certain topic that could help them choose a lifetime decision, also can be a big resource for people seeking for jobs. AI knows exactly where you are and every place around you it can use its technology and give you places that are hiring just by asking it one simple question. AI can be good for people looking for answers and fast simple replies. It helps students study and complete homework stress free without it taking a toll on their mental health. AI is changing the world making things faster, easier, and more efficient, allowing them to perform tasks that usually require human intelligence like recognizing images, understanding language and giving fact advice. AI can automatically do tasks for you such as data entry, quality control, focus more strategic and creative tasks. AI is more used when you have problems with logic and customer service. AI can analyse high amount of data and identify patterns making predictions about future events with a high degree of accuracy. AI can personalise products and services. AI can analyse customer data to make personalized recommendation and improve the customer experience but also AI can recognise and copy images and speech which has application in security, health care and entertainment for example. AI can analyse medical and mechanical problems and be at your service.

AI can make accurate decisions in less time than human brain. It can provide real time data analysis and understanding for business perspectives faster decision making often invisible to humans. AI does not have emotions that's why you can come with questions and tasks for AI and will be solved even health care industry by improving diagnostics and monitoring humans sickness allow treatment quickly efficient innovations based on AI, drug discovery type of treatments reducing error and leads to streamlining operations automate every day reduce manual errors that AI cannot afford mistakes however AI operate with precision high quality efficiency transforming the way we live, learn and work, but although it comes with lots of advantages there's also a handful of negatives such as, one of the biggest disadvantage and fear in AI is it can easily replace the human job and leave people in a hard time and also encouraging human laziness we will lose our motivation to think, create, solve problems by ourselves, this will lead to absence of human performance and when I say that AI it can never bring that human touch it can never be as creative as a human it is, because

there is no emotions, empathy, feeling, common sense, the ability to imagine experience that haven't happened is a key part of creative thinking, AI systems are created to learn from existing data that means AI follows the steps repeat day by day data as humans we should not rely on a technology that takes away the thoughts our own and our abilities like problem solving, critical thinking, adaptability, time management, inclusion and interpersonal we should stop this before it's too late if that's not enough then I have a couple more Artificial Intelligence is being used to track people it's invading our privacy it can take our personal information interference in our personal life our personal information can be misused by AI also doesn't stop here, AI it could easily fake scenarios about people online and catfish to thinking stuff that aren't true and can also people can feel independent without AI humanity will lose their fate in their selves companies will invest on this technology more what if it brakes will be a major risk thinking about the loss of customers and funds instead of people to control Artificial Intelligence, actually will be the opposite we will be controlled by Artificial Intelligence by thinking can help us it actually can make us turn against our own human thinking and completely brainwash our future.

Although AI is really smart you could never trust a robot for day to day important tasks there can be a typical crash out and leave people in danger

Another problem is AI is a technology generated of off pure facts it has no emotions and does not know off empathy and can make unfair decisions without even realising

AI can be used to track people and invade their privacy it can break in to your personal details and important things such as passwords and banking details,

It can also generate fake voices and fake faces which is really dangerous considering how much children have social media in their day to day lifestyle and they can be easily be tricked even for adults AI makes things hard to know what's real and what's not, this is a major issue for AI to be involved in health care, medicine, medical symptoms and so in if AI makes a mistake and it leads to people being in threat to their life who is to be responsible for this action? As well as in police and FBI and so one if they make a mistake whose to blame there's no 100% trust that they won't crash out and leave real people in a big disaster.

It also makes people be independent on a technology and not use their own creativity taking all the humanity out of the world and everything being part of or answered from AI,

AI is a human made technology but if we let it get smarter and more efficient instead of us controlling AI it will become that AI will control us, think about the future and the next generations do we want our grandkids living in a world based of off artificial intelligence? Where there will be no creativity and no desire to learn. They will be dependent of a technology to complete their day to day tasks and not use any effort of their own and

empathy and real emotions will be lost now to artificial technology theres loads of negatives and positives but heres just a summary of my own opinion,

I think although AI can be great help we should not let this get out of control and brainwash the whole world, some stuff just ned to remain practical and human controlled AI can be good but i don't want a future where a robot will be in charge of my day to day lifestyle, think about our future generations we are the ones in charge to create a better and healthier future for ourselves and our next generation artificial intelligence can be good at one point but not that extreme i can never look at a robot and treat and talk to it like a real person. I as a individual think artificial intelligence is soon guna get out of control and take over the humanity side to the world artificial intelligence can play fast and clean but its the human touch that makes experiences in life unforgettable , if you ask me a connection with a human is what purpose and meaning comes to life no robot can ever replace a bond you can create with real human beings and i wouldnt feel comfortable and safe knowing that a robot knows exactly where i am and what im doing im perfectly fine with the technology there is now and dont think its necessary to turn artificial intelligence better and make it into robots that control our day to day life instead of embracing the artificial intelligence we may get worse and make it stronger and more powerful than it should be i think artificial intelligence can be absolutely great with helping and answerung questions but we should not ecourporate it into medicine and health care and jobs that requier the servise of humans Artificial intelligence is a great resource but i think it should remain a app on your devices and not be turned into something more bigger and greater, i could never trust a robot to deal with problems that concern human health and life pathway, artificial entaligance can be good but i do not want it to be GREAT
