

Basic Digital Safety.

Digital security also called cybersecurity is what is used to protect information, digital assets and devices, personal data ,bank accounts, files and virtual money

The main and most well-known security is a "password" to verify a personal identity .cyber security professionals recommended that:

- do not use public WI-FI
- use only strong password
- update your computer quire often
- before you open new link check it first
- do not provide personal information over the phone or online
- do not use dengerous websites
- do not use the same password for more then one application

If we follow these recommendation , we will protect ourselves to a large extent.
