

INFORMATION TRANSFER

ONLINE

A traditional learning model—students obtain, understand and retain information from a variety of sources.

Core Enhancing Technology

Key Enhancements

- Putting content on Moodle provides 24/7 accessibility and flexibility for learners
- Online content can be provided in a variety of engaging media
- Dynamic—hyperlinks, related content and interactivity provide advantages over lectures or textbooks

Moodle is the best place to make course content available to students—it's available anywhere with an internet connection and the links to courses, modules and individual teaching sessions can be made explicit, along with supplementary instructions or explanatory text. You can also use tools such as Book, Database and Glossary to present information in different ways.

Content created with any of the Office tools including Word, Powerpoint and Excel, can be uploaded to Moodle via the “File” resource or embedded directly within a Moodle page using the “Label” resource.

NB—Word files should be uploaded in PDF format unless they are intended to be editable by students, such as forms or templates.

A useful method of creating online content is the “microlecture” which is a short, focussed video on a key or difficult concept. The two core tools which enable the creation of microlectures are Panopto and Office Mix—each have their own pros and cons—choose the one which best suits your objectives.

Clickview is a repository of educational videos on a variety of topics, together with access to the last 30 days of the main 22 Freeview channels, fully searchable by keyword. You can also create interactive videos from Clickview videos, building in quizzes or thinking and discussion prompts to guide independent viewing and maintain engagement.
