SNOWDROP GONDOLA LIFT

MOODBOARD

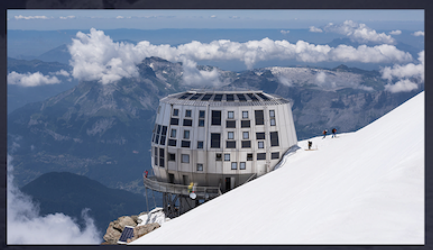

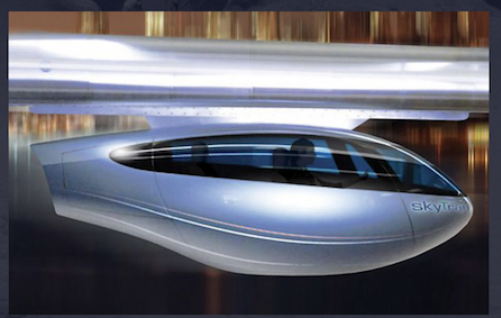

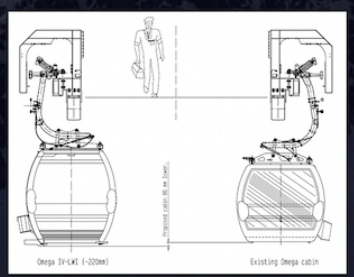

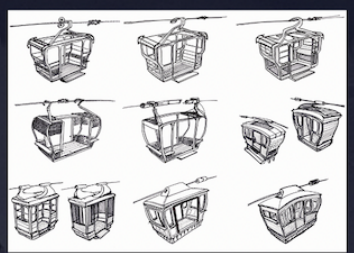

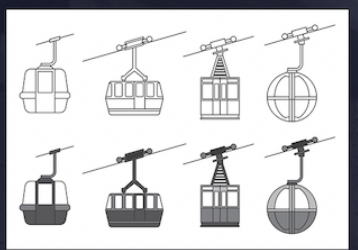

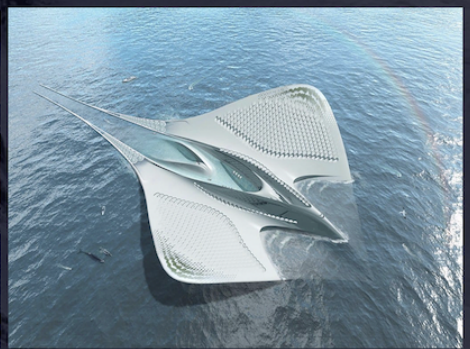

SNOWDROP GONDOLA LIFT

Initially, the idea was born on one of my ski trips as I was thinking what transport could need improvement to be able to complete all the requirement for safe use in a moment of a pandemic outbreak such as the current Covid-19 virus. Many of the cabin, or so-called gondola, lifts have different variation of passenger capacity. The one that brought my attention was the smaller ones like the 6-12 passenger ones. The current regulations allow cabin of 6 passengers to not allow more than 2-4 people as it can reduce the spreading.

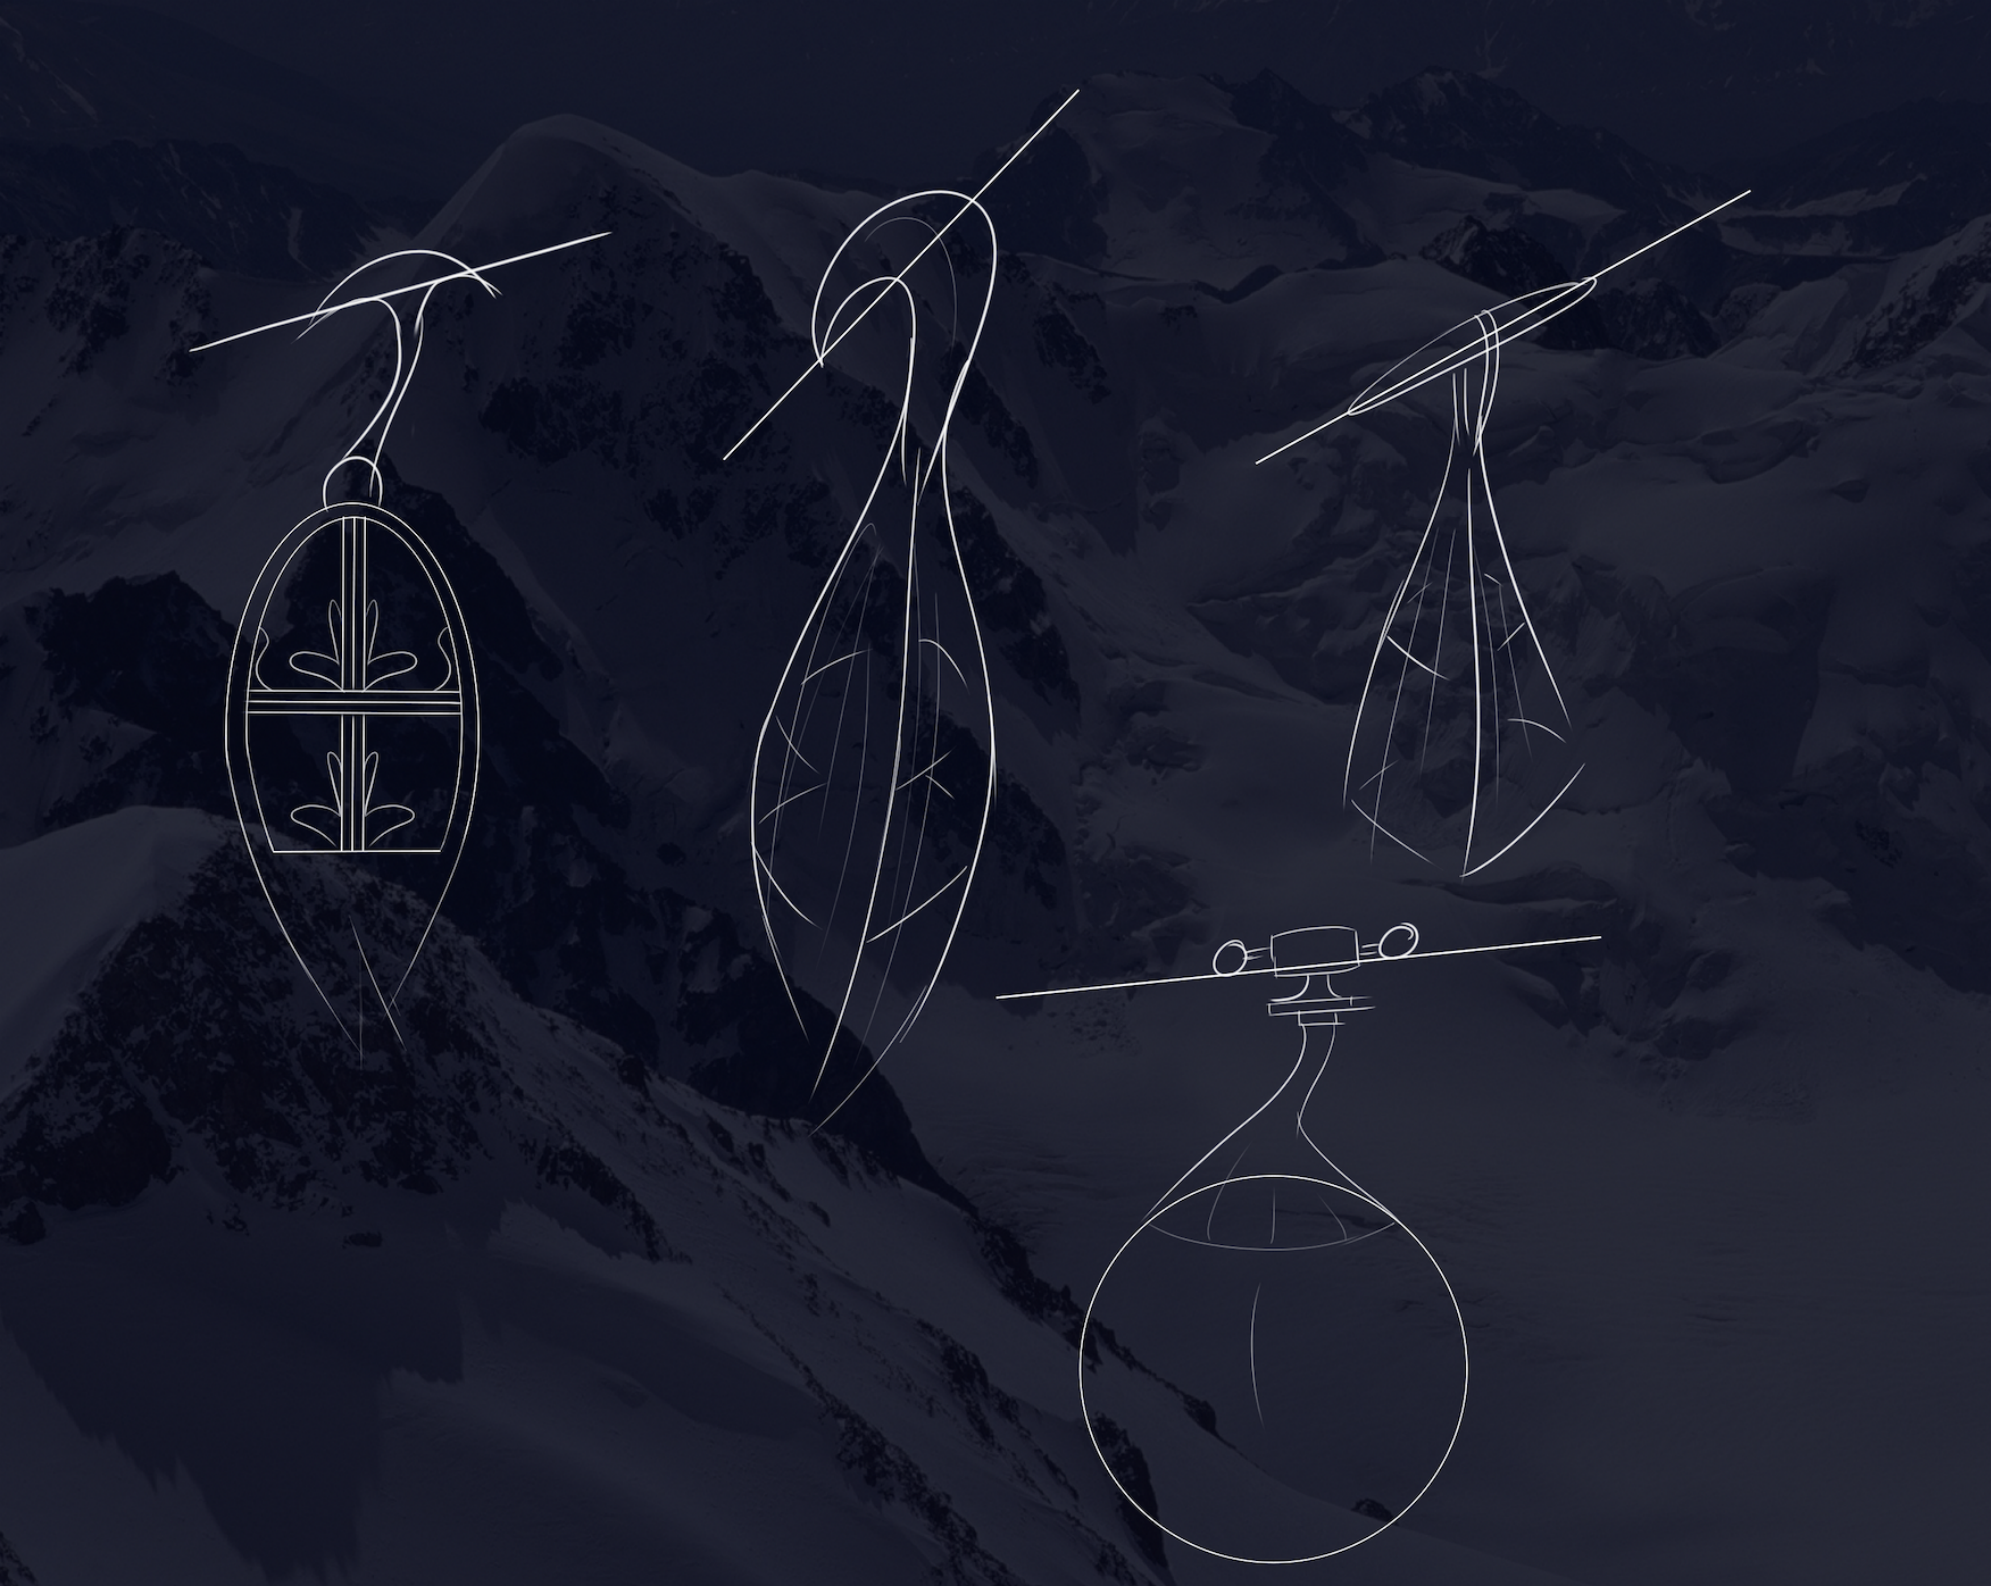

However, that cannot guarantee the full protection and safety of our health and further observation needed to be made in order to see that the social distancing is helpful. As we the queues were longer on weekends I took the opportunity and asked some of the staff members if the social distancing particularly in the cabins is helping. The majority of the people I've asked disagreed that it was helping as they believed that something more should have been done in the name of the protection.

After sketching a few designs, I started gaining an idea of what I wanted to achieve. My idea was always circling around taking a flower's silhouette as an inspiration as my aim was to produce a shape as natural as possible with the surroundings. The conclusion brought me to the Galanthus (snowdrop) - one of the best known early spring flowers in Bulgaria. It had an oval shape inspiring and allowing me to produce a two-deck gondola lift that could easily fit 8 passengers.
