

Artificial Intelligence refers to the capacity of a digital computer or computer-controlled robot to perform tasks that are usually associated with intelligent beings. The phrase is widely given to the attempt to create systems with human-like cognitive processes, such as the capacity for reasoning, discovering meaning, generalise, or utilise knowledge from past experience(Brittanica,2023)

AI is widely used among an extensive range of applications, recommendation algorithms such as chatbots on websites, in the shape of smart speakers, predictions based on weather and forecasting financial reports and reducing multiple types of unnecessary cognitive labour such as bookkeeping or video editing. Furthermore. Artificial Intelligence is also used for gaming, operating autonomous or self-driving vehicles, and processing language(Frankenfield,2023)

There are multiple benefits of accommodating the usage of artificial intelligence in our daily lives such as the time taken for a task to be completed by Artificial intelligence is faster than the time taken for humans. Secondly, the succession rate of tasks being completed by AI is much higher compared to humans. Next, multiple functions can be completed at the same time. This is because due to AI's multi-faceted system, it is able to execute various tasks at once hence providing more efficiency in a limited time. Besides that, AI is capable of long-term and complex calculations this is because the system of AI is there are no limitations when solving complex and deep problems(Chhaya, Ravindra,2020). Thus, the advantages of AI are beneficial and improve our daily lives.

The disadvantage of implementing Artificial intelligence is firstly human jobs will be affected. This is because due to companies or businesses relying more on technology instead of labour, the demand towards man-made labour will decrease at the same time an increase in the unemployment rate. Secondly, the creativity of AI when executing a task relies on the programmer. This means that AI has a limited creativity outlet and solely depends on the programmer. (Chhaya, Ravindra,2020). Besides that, the disadvantages of AI are the programme could be mismatched and AI's programming could be done differently based on the command. This refers to there would be errors and miscalculations performed by AI due to its nature of it.

According to Britannica, Ethics is often known as a moral philosophy, it is the study of what is ethically good and evil, right and wrong. Ethics could also refer to any set of moral beliefs or principles. Furthermore, the nature of the ultimate value and the standards by which human activities can be deemed right or wrong are the two of the most fundamental challenges of practical decision-making. Moreover, even though ethics is viewed as an extension of philosophy, there are many correlations with other areas of study such as economics, sociology and politics. (Singer,2023)

An ethical issue a leader should consider before implementing Artificial Intelligence is unemployment. This is because due to the automation of labour, there is companies rely less on man-made labour as compared to technology, thus creating lesser demand for man-made labour which results in an increase in unemployment(World Economic Forum,2016)
