SAFETY AT WORK

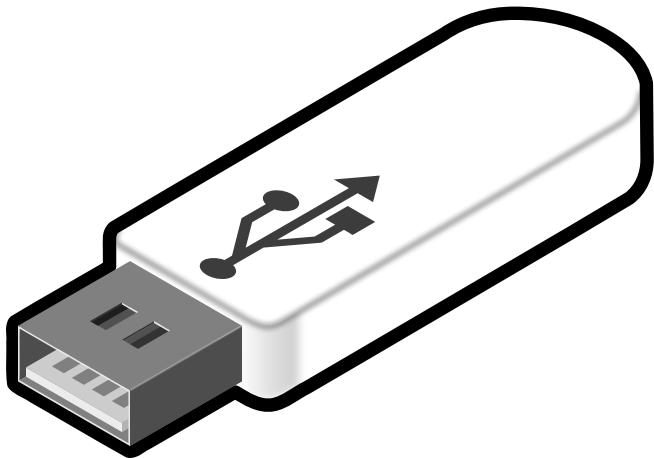

PROTECTING YOUR WORK DATA

protecting your work data means you should never mix home password and work password because work data have so many application and emails it easy to mix them up your personal home password with work password there is survey that was done by information solution that one third of the people use same log in for the home and work account and that can cause if one password is compromise then everything will be compromised.

change your password
change your password regularly some organisation do change password for their employees to protect their data this will avoid their breached.

unknown usb

do not use unknown usb because it can give your device some viruses that can eat your information if you are offered an usb by someone you know that doesnt mean you are aware of what is inside is better you protect your device.

ALWAYS BE AWARE OF YOUR DATA.

Protecting your personal data is critical because if a stranger knows all your personal data like address pin number of your personal account and your date of birth data held by your doctor and internet protocol address according to European commission personal is any information collected together that can identify someone. reference article 2 and article 4.

Protect your device

protecting your device means you always lock your phone with passwords this protect you and the young people who live with you because they can start chatting with strangers if not supervised and even buy things from the internet alays know where your phone is and do not put personal information on your unlocked phone. reference Lloyds bank.com

Become critical when accessing website and new information

fraudsters use public Wi-Fi to steal data is always better to use mobile data rather than a public Wi-Fi it is always good to be vigilant with your wifi password use special characters mixed with numbers etc.
