Module code:LCSH4002

Assignment section part 3

1.Introduction (Need 200 Words – 156 words – 43 words left)

The Digital skills are now an essential, it became part of daily actives, such interaction with people around the world, shopping, online banking, using health service such booking the doctor appointment, by using NHS online service to managing a health condition, getting help with health condition symptom. By using different platform of the digital technology, it encourages us to do our daily life task. In the workplace and education are encourage us also support individual to use in the digital practice. In the workplace today are encouraging also recognised people to have a digital skill. According to Cristina V, Emma G, Neil, W ,(2018,) In the work with student nurse and healthcare workforce, we recognised that digital skills and capabilities have become a key skill required to achieve digital transformation. The potential positive of digital technology from health to social outcome is that it facilitates self-manager of individual health and improve self-care for minor ailments. Improved take up of digital health tools and services.

2. Research design

2.1. Research Question – How does digital inclusion affect Practice health in Health and social care? (100 words)

A quantitative research design was used for this research because the current study's objective was to identify the digital tool have been increased in usage by the students and teachers.

The current study's objective was to look at the digital tool that the students used the most.

According to the current study, Microsoft team is a critical tool used by students and teachers, as well as the most Successful Learning and coloration at UWSTD.

To obtain all the data, an online survey and interviews were both carried out. The Microsoft team's use and practical application at UWTSD is made easier and more efficient for the students and teachers at the University.

2.2. Method - In this section you will need to describe:

The methods used in your research, including the questions asked and how you recruited participants. (400 words)

The quantitative research method was used to collect information from participants after the questionnaire quantitative research looked at the data numerically answering questions such as how frequently the student uses Microsoft, what the advantages and disadvantages of using Microsoft are.

By use the group of students to participant also by interviews individuals.

The important was to consider the type of question and the content of question.it was use the open-ended question each combination was used. According to Saunders (2002) to use open -ended question are the best for qualitative research.

On the other hand, qualitative research provides an in-depth analysis, answering questions such as what the effects are, what the perception is, and how frequently they occur. Because the data was simple, and it was assumed that it would be collected quantitatively.

To ensure the validity and reliability of the result it was carefully consider each question in the survey. In term of language the question was clear and precise, and the language use that respondent easily to make sure the participant fully understands. Revised question.

Make sure the appropriate length and question is clear also it makes sense. By ensure the profile of the survey are respondent to the participant.

Interview and survey are two ways that you can gather information about the people belief or behaviours. Use interview to gain detail from a few people.

According to Robson C (1993) Interview is the best used to learn detailed information from few specific people.

Digitally mediated research methods' means the use of online and other digital technologies, such as online surveys, text messages and interactive voice response systems for research purposes. The following section highlights the advantages and limitations of digitally mediated research methods compared with other research methods. The adaptability of this method of data collection has been highlighted in a summary of the purpose and history of survey research.

**2.3. Ethical Considerations - In this section you will need to describe:
Any ethical considerations that were made. (100words)**

Ethical considerations were applied to the student's data.

The research team adheres to a strict code of conduct when collecting data from students. Using ethical research methods and procedures to achieve significant research objectives. Protect the rights of research participants. Respondents should participate with informed consent. The principle of informed consent requires researchers to provide individuals with sufficient information and assurances about participating for them to understand the implications of participation and make a fully informed, considered, and freely given decision about whether to participate, without the use of any pressure or coercion.
