Water consumption & mgmt.	Effective waste water collection and reusage - alleviate pressure on the sewage system to use that water for alternatives (washing roads, etc.) Rain water collection reservoirs in each neighborhood for times of disruptions, and for the residents to use that water for their plants, cars, etc.	I lived in the UAE and Morocco before Luxembourg and water is scarce due to the desert climate. Finding a way to sustainably consume and manage water is vital for all communities, but especially those with water scarcity.	Infrastructure is a big concern. The infrastructure in Michigan has caused water contamination in the past. We need cleaner more sustainable water options. Michigan is surrounded by the largest source of fresh water in the world. I am not sure if this could be a sustainable source one day but I do worry about the exploitation of fresh lake water. Need to learn more about this.	Water is a concern for some people in Michigan due to contamination. We need safer more sustainable options.	Need to do more research on this but generally I think we use too much water and conservation should be a focus for society.
Food production	Produce food that works best in our type of climate, most optimal use of land, water, soil	Local food is always best and more fresh.	There are so many chemicals in food preservatives. This is something that worries me. It is not natural. I prefer food sources that are as close to the natural state as possible.	I like fresh food and that means close to the source.	It is overwhelming how many food options there are in London. It is too much and can't be good for the environment.
Food supply	Grow core staples in a specific, inclosed area for emergencies, such as vertical farms seen in the Netherlands	Related to above - local is best. Makes the supply chain easier.	'Farm to table' has become an overused buzzword but the concept is good and should be the standard for sustainable communities.	Close to the source	Too much food and so much of it is bad. Less, but better options.
Clean air	Cut all usage of coal, oil for energy. Put in constraints of cars, ban higher polluting cars from dense civilian areas, invest in greener modes of public transportation	Cut down on emissions and car ownership.	Too many cars here in Detroit. Less cars would be good but the infrastructure is lacking. We have many bike lanes but they are not protected. More public transit.		Too many people and too much pollution in London. I really notice this when I leave the city.
Green	Incentivize and grow	More education is	There is a lot of		Green business is

business	businesses that support the renewable ecosystem, offer tax credits to grow industries such as solar, wind, etc. R&D, etc.	needed. If people know more about green business, they will support them more.	opportunity for the automotive companies in Detroit to be leaders in green business. There is a whole ecosystem of car suppliers that need to become more green. This is starting to happen but more is needed.		good. No opinion.
Green jobs	Create tax credits to convince companies to do R&D, discourage high carbon related activities	I work in HR. More training and awareness in business is needed for green jobs.	As the car capital of the world, there is huge opportunity to turn many of these jobs into green jobs.	All jobs should be green jobs. Sustainability should be part of everyone's job but I know we are from that reality.	Same as above. Green jobs are good.
Reduced carbon dioxide	See clean air - continue to offer incentives for residents to buy ebikes	Not sure about this one. Same point as clean air. More needs to be done.	Less cars :)	Not sure about this one.	
Reduced consumption	Educate citizens of harm of overconsumption on themselves, community, planet, etc.	Everyone needs to take individual responsibility to stop over consuming. Again, more awareness and training needed.	Shop local. This will "limit" us to think more about what we buy and where we buy it from.		
Reduced pollutions	See above	Hold businesses accountable for what they are doing. Individuals need to do their part too.	Less cars :)		
Zero waste	Ban single use plastic, make all food packaging either compostable or recyclable	Recycle, buy sustainable products. We all need to do our part to cut down on waste.	Landfills are a terrible solution for waste management in the US. I would really like to see more sustainable options.
