From the General Editor

Winged Word

...ago, James Loeb announced the founding of the Loeb Classical Library and his intention to bring the written treasures of the ancient Greek and Roman world "within the reach of all who care for the finer things in life." Now it gives us great pleasure to welcome you – old friends and newcomers, scholars, students, and general readers alike – to the digital Loeb Classical Library, and to invite you to enjoy its Greek and Latin texts alongside English translations, in the familiar ways and in surprisingly new ones.

The *Tetrabiblos* of the famous astronomer and geographer Claudius Ptolemaeus (ca. 100–178 CE) of Egypt consists of four books, the title given in some manuscripts meaning 'Mathematical Treatise in Four Books', in others 'The Prognostics addressed to Syrus'. The subject is astrology; which in Ptolemy's time as down to the Renaissance was fused as a respectable science with astronomy. Translations and commentaries are few; and only three Greek texts had been printed (all in the 16th century) before the present one and the one begun by F. Boll and finished by Emilie Boer in 1940.

TETRABIBLOS I.

THE QUADRIpartite MATHEMATICAL TREATISE, OR
"TETRABIBLOS," OF CLAUDIUS PTOLEMY.

BOOK I.

1. INTRODUCTION.

Of the means of prediction through astronomy, O Syrus, two are
the most important and valid. One, which is first¹ both in order and
in effectiveness, is that whereby we apprehend the aspects of the
movements of sun, moon, and stars in relation to each other and to
the earth, as they occur from time to time; the second is that in
which by means of the natural character of these aspects
themselves we investigate the changes which they bring about in
that which they surround. The first of these, which has its own
science, desirable in itself even though it does not attain the result
given by its combination with the second, has been expounded to
you as best we could in its own treatise² by the method of
demonstration. We shall now give an account of the second and less
self-sufficient method in a properly philosophical way; so that one
whose aim is the truth might never compare its perceptions with
the sureness of the first, unvarying science, for he ascribes to it the
weakness and unpredictability

TETRABIBLOS III

aspect whatever to the sun and to Saturn, or if Saturn himself is in an harmonious aspect to the sun, either conjunction, sextile, or trine, both being in power, we must conjecture long life for the father; if they are weak, however, the significance is not the same, though it does not indicate a short life. If, however, this condition is not present, but Mars overcomes¹ the sun or Saturn, or rises in succession to them, or when again Saturn is not in accord with the sun but is either in quartile or in opposition, if they are declining from the angles, they merely make the fathers weak, but if they are at the angles or rising after them, they make them short-lived or liable to injury: short-lived when they are upon the first two angles, the orient and the mid-heaven, and the succedent signs, and liable to injury or disease when they are in the other two angles, the Occident and lower mid-heaven, or their succedent signs. For Mars, regarding the sun in the way described,² destroys the father suddenly or causes injuries to his sight; if he thus regards Saturn he puts him in peril of death or of chills and fever or of injury by cutting and cauterizing. Saturn himself in an unfavourable aspect to the sun brings about the father's death by disease and illnesses caused by gatherings of humours.
