

Refined. Meaning that buttons would have images that relate to the action that that button would carry out as well as a setting page that would allow for all accessibility options such as colorblind options. Another aspect of touch that is lacking on this display is that of Braille. ~~This~~ This display cannot handle any type of braille as it is a touch screen sphere without ~~the~~ buttons. This leads into the next improvement which is the inclusion of speakers as this would allow ~~for~~ for users with visual impairments to be able to explore the exhibit on this display through audio alone. For people with ~~audio~~ hearing problems the interface would need to include options for large text descriptions so that these users could grasp how to navigate and use the exhibits. Another option that is featured on this exhibit display is the option for multiple languages to be selected. This allows for more users to be able to use the display and to learn from the exhibit.
