

Basic Digital Safety

Aim

This poster will tell users how to be safe when you use your devices such as mobile phone or your computer.

Phising

make sure you check the email of the person before you click any link in the email.

don't give your sensitive information to websites who look fake and don't have https.

never share personal information using text messages, it is a scam.

Safe Wifi

public WIFI's are most of the time not secure. Hackers can easily attack it.

make sure that you use a private wifi like your home wifi.

if you use a public WIFI, hackers can easily steal your data by connecting to it.

Basic Digital Safety Tips

Strong Passwords

it is important that you make a very strong password to protect your account and your persona; data.

Privacy

do not share any personal information online and make sure that your account is private. hackers can easily use that information to blackmail you.

Updates

software and app updates is really important. this will fix any bug issues in your app and phone which will stop hackers from attacking any weakness

Data Backup

back up your data regularly in case of an attack, you will not lose your important data and it will be backed up.

Extra Tip

make sure you educate yourself about everyday risks and be safe from any attackers.
