

Lecture 6

Geometry Cleanup, Repair and Concept Modeling

14.0 Release

A horizontal banner with a yellow background. It features four main visual elements: a blue fluid flow simulation on the left, a purple gear with a glowing center in the middle-left, a green concentric circle pattern in the middle-right, and a 3D isometric view of a mechanical assembly on the right. Below these elements is a dark blue bar with four white text labels.

Introduction to ANSYS DesignModeler

Preprocessing Workflow

Geometry Cleanup/Repair: Introduction

Why Repair?

- **Several translation methods available to enable data exchange with CAD/CAE systems**
 - Direct Integration/CAD Readers
 - Import of generic CAD formats (IGES, ACIS etc)
- **Translation can:**
 - Return incomplete, corrupt, or disconnected geometry
 - Requires repair
 - Return geometry details unnecessary for CAE analysis
 - Requires defeaturing

How to Fix?

- **Geometry cleanup**
 - Processes required to prepare geometry for meshing
 - Fix incomplete or corrupt geometry and connect disconnected geometry
 - Remove unnecessary details (defeathering)
 - Decompose geometry into meshable sections

Geometry Cleanup/Repair: Introduction

- DM provides geometry tools to:
 - Analyze
 - Repair
 - Modify/Simplify
- All these commands are available under the Tools Menu
- May need to view the model in wireframe mode to visualize the defects
- DM also give the ability to color edges depending on connectivity

Typical Geometry Issues

Many potential issues

- Missing faces
- Sliver faces
- Hard edges
- Small edges
- Sharp angles
- Others ...

These issues must be fixed to

- Create watertight volume bodies
- Prevent meshing issues

Missing faces

Sliver faces

Hard Edges

Small edges

Sharp angles

Analysis Tools

- Set of features that provide information, detect faults in geometry

RMB on the part

Repair Tools

- Easy search and fix of unwanted geometrical features or geometric errors
- Can be executed on both frozen and active bodies
- Repair Types
 - Repair Hard Edges
 - Repair Edges
 - Repair Seams
 - Repair Holes
 - Repair Sharp Angles
 - Repair Slivers
 - Repair Spikes
 - Repair Faces

Repair: Automation

- Automatically detects and lists out geometrical issues
 - Zooms into the location, when clicked on the items in the list
- Proposes fixes to the issues
 - Choose a different method to fix, if needed
- Analyze the list
- Fix issues all at once
 - Upon clicking “Generate”
 - Can’t be done one after the other

Repair: Automation

- Automatically detects and lists out geometrical issues
- Highlights the location of fault in the geometry
 - Zooms into the location, when clicked on the items in the list
- Proposes fixes to the issues
 - Choose a different method to fix, if needed
- Analyze the list
- Fix issues all at once
 - Upon clicking “Generate”
 - Can’t be done one after the other

Repair: Automation

- Automatically detects and lists out geometrical issues
- Highlights the location of fault in the geometry
 - Zooms into the location, when clicked on the items in the list
- Proposes fixes to the issues
 - Choose a different method to fix, if needed
- Analyze the list
- Fix issues all at once
 - Upon clicking “Generate”  Generate
 - Can’t be done one after the other

Small face removed

- Used to remove features such as fillets, chamfers, holes etc., and automatically heal the geometry at those locations
- Four Options for Healing: Automatic, Natural, Patch or No healing

Automatic

Patch Healing

Natural Healing

- Edge Delete also available (see Appendix)

- Merges a set of edges or faces
- Useful to reduce model complexity
- Type
 - Edge merging
 - Face merging
- Method
 - Manual: user selects the entities to merge
 - Automatic: clusters of entities to merge are automatically selected and highlighted

Edge Merging

Face Split

- Allows faces to be broken down by:
 - Points and Edges
 - Combinations of sketch and 3D geometry
 - Locations
 - “Click” on the surface
 - Do not need to close the loop

Surface Patch

- Fills the gaps in surface bodies
- Requires closed loop of edges
- Edges can be from different surface bodies
- Allows selection of multiple patch operations in a single go

Gap filled using Surface Patch

Details of Fill3	
Fill	Fill3
Extraction Type	By Caps
Target Bodies	All Bodies
Preserve Capping Bodies	No
Preserve Solids	Yes

Cap surface bodies must be selected

- Creates enclosure around the bodies
 - Useful for external aerodynamic analysis
 - Can be used for extracting internal flow domain
- Input
 - All or selected bodies
 - Shape of enclosure
 - Extent of enclosure
- Output
 - A frozen body around the selected parts with specified extents
 - Internal flow volume as a result of automatic Boolean subtract
- Supports symmetry models
- Full or partial models can be included in enclosure

Enclosure created for an airplane

Symmetry

- Defines symmetry for the model
- Input
 - All or selected bodies
 - Up to three symmetry planes
- Operation
 - Symmetry planes slice the model
- Output
 - Sliced model (part lying on the positive side of the axis is retained)

Tip: The symmetry tool can be used as visualization tool when discovering the model (then the operation is deleted)

Using Symmetry

Details View

Mid-Surface created for a pipe geometry

Surface Extension

- Allows extension of surface bodies to the desired extent
- Extension type
 - Natural: Based on gradients of selected edges
 - User Defined: User specifies the direction

Model with gap

Details View	
Details of SurfaceExt2	
Surface Extension	SurfaceExt2
Surface Extension Group 1 (RMB)	
Extent Type	Natural
Edges	2
Extent	To Next

Details View of Surface Extension

Model with gap closed

- Joins surface bodies together such that their contact regions share common edge
 - Prerequisite for conformal meshes
- Takes two or more surface bodies as input
- Imprints edges on all bodies where they make contact

Surface bodies to be Joined

Details View
of Joint

Surface bodies after Joint

Workshop 4a – Geometry Cleanup*

***Optionally continue with Concept Modeling lecture and complete workshop 4b**

Concept Modeling

- **The features in the Concept menu are used to create and modify line bodies and/or surface bodies which become FE beam or shell models**
- **To begin Concept Modeling, you can either:**
 - Create line or surface bodies using the features in the Draw toolbox to design a 2D sketch and/or generate a 3D model
 - Use the Import external geometry file feature
- **Line bodies**
 - Lines from points
 - Lines from sketches
 - Lines from edges
- **Surface bodies**
 - Surfaces from line bodies
 - Surfaces from sketches
 - Surfaces from 3D edges

Creating Line Bodies (1)

Lines From Points

[Main Menu] Concept → Lines From Points

- Points can be any 2D sketch points, 3D model vertices or Point Feature (PF) points.
- A point segment is a straight line connecting two selected points.
- The feature can produce multiple Line Bodies, depending on the connectivity of the chosen point segments.
- The Operation field allows Add or Add Frozen choices for line bodies.

Creating Line Bodies (2)

Lines From Sketches

[Main Menu] Concept → Lines From Sketches

- Line bodies created based on sketches and planes from faces
- Multiple Line Bodies may be created depending on the connectivity of the edges within the base objects
- Select sketches or planes in the feature tree then “Apply” in the detail window
- Multiple sketches, planes, and combinations of sketches and planes can be used as the base object for the creation of line bodies

Creating Line Bodies (3)

Lines From Edges

[Main Menu] Concept → Lines From Edges

- Creates line bodies based on existing 2D and 3D model edges
- Can produce multiple line bodies depending on the connectivity of the selected edges and faces
- Can select edges and/or faces through two fields in the detail window then “Apply”

Line Bodies

ANSYS Split Edges

Split Line Body

[Main Menu] Concept → Split Edges

- Splits line body edges into two pieces
- Split location is controlled by the Fraction property (e.g. 0.5 = split in half).
- Other Options:
 - Split by Delta: Distance between each split is given by Delta along the edge
 - Split by N: Number of Divisions of the Edge

Cross Sections (1)

Cross Sections

- Cross sections are attributes assigned to line bodies to define beam properties in the FE simulation
- In DM, cross sections are represented by sketches and are controlled by a set of dimensions
 - Note: Design-Modeler uses a different coordinate system for cross sections than the one used in the ANSYS environment (described later)

Cross Sections (2)

- Cross sections are selected from the Concept menu
- A cross section branch is inserted in the tree where each chosen cross section is listed
 - Further details in appendix

Concept Menu

List of Cross Sections

Cross Sections in Tree Outline

Surfaces From Edges (1)

Surfaces From Edges

[Main Menu] Concept → Surfaces from Edges

- Creates surface body using line body edges as the boundary
- Line body edges must form non-intersecting closed loops
- Each closed loop creates a frozen Surface Body
- The loops should form a shape such that a simple surface can be inserted into the model:
 - Planes, cylinders, tori, cones, spheres and simple twisted surfaces

Planar surface

Non-planar surface

Details window:

- Flip surface normals
- Input thickness which will be transferred to the FE model

Details of Surf1	
Line-Body Tool	Surf1
Edges	4
# Edge joints generated	4
Flip Surface Normal?	No
Thickness (≥ 0)	0 mm

Surfaces From Edges (2)

- Creates surfaces from existing body edges
- Can be solid or line body edges
- Edges must produce non-intersecting closed loops

Existing solid body edges are selected for new surface boundary.

Details View	
Details of Surf1	
Line-Body Tool	Surf1
Edges	6
Flip Surface Normal?	No
Thickness (≥ 0)	0 mm

New, frozen, surface body generated (note, solid body is hidden).

Surfaces From Sketches

[Main Menu] Concept → Surfaces from Sketches

- Creates surface bodies using sketches as boundaries (single or multiple sketches are OK)
- Base sketches must be closed profiles which are not self intersecting
- May choose to “Add” or “Add Frozen” operations
- Can reverse normal direction “No” in Orient With Plane Normal field
- Can enter thickness which will be used in creating the FE model

Details of SurfaceSk3	
Surface From Sketches	SurfaceSk3
Base Objects	1 Sketch
Operation	Add Material
Orient With Plane Normal?	Yes
Thickness (≥ 0)	0 mm

Workshop 4b – Beam & Shell Modeling

Contents

Edge Delete

- Used to remove blends, chamfers, and holes from surface bodies
- Can also be applied to imprinted edges from all body types
- Can choose healing types: Automatic, Natural or No healing

Details of EDelete3

Edge Delete	EDelete3
Edges	8
Healing Method	Natural Healing

Connect: Example

Edge Connect

Model with a gap

Tolerance	0.1 mm
Location	Preserve First
T-Junction	Interpolated

Using
T-Junction

Connect: Example

Face Connect

- Additional options as per edge connect

Model with a gap

Surfaces From Edges

- A line body with no cross section can be used to tie together surface models
- In this case, the line body acts merely as a mechanism to insure a continuous mesh at the surface boundaries

2 Surface Bodies

Line Body (no cross section)

Result is continuous FE mesh at surface interface

Surface Patch

[Main Menu] Tools → Surface Patch

- Attempts to fill gaps in the model
- Uses similar healing methods as face delete (natural and patch)
- Complex gaps may result in multiple surfaces being created to fill them

2 holes selected for patching

Two patches created using multiple surfaces

Edge Joints

- Edge Joints are the glue that holds together bodies where a continuous mesh is desired
- Creating surface and/or line multi-body parts with coincident edges results in automatic creation of edge joints
- Joints can be created manually ([Main Menu] Tools → Joint) where no coincident topology exists

Edge Joints

- Edge Joints can be viewed by turning on the Edge Joints option in the View menu.
- Edge joints are displayed in either blue or red.
 - Blue: edge joint is contained in properly defined multi-body part
 - Red: edge joint not grouped into the same part

No Edge Joint

With Edge Joint

Cross Sections

Highlight the cross section in the Tree to modify dimensions in the Details window

Dimension Editing

- Cross section dimensions can be repositioned via a RMB and choosing Move Dimensions

Assigning a cross section to a line body:

- Highlight the line body in the Tree
- A cross section property appears in the detail window
- Click in this field and choose the desired cross section from the drop down list

Details of Body	
Body	Line Body
Faces	0
Edges	6
Vertices	6
Cross Section	Not selected

Cross Sections

- A User Integrated section can be defined in DM
- The cross section is not sketched, rather the cross section's properties are placed in the details window

- **A** = Area of section.
- **Ixx** = Moment of inertia about the x axis.
- **Ixy** = Product of inertia.
- **Iyy** = Moment of inertia about the y axis.
- **Iw** =Warping constant.
- **J** = Torsional constant.
- **CGx** = X coordinate of centroid.
- **CGy** = Y coordinate of centroid.
- **SHx** = X coordinate of shear center.
- **SHy** = Y coordinate of shear center.

Steps for creating a User Defined Cross Section:

- Select Cross Section → User Defined from Concept Menu
- A Cross Section node with an empty sketch will be added in the tree outline
- Click Sketching tab to draw the required sketch (Must be a closed Sketch)
- Click Generate. DM will compute the Cross Section properties and show them in the details view. These properties cannot be changed.

Cross Section Node

Cross Section Alignment

- As shown below, in Design-Modeler the cross section lies in the XY plane
- Cross section alignment is defined by:
 - A local or cross section +Y direction
 - Default alignment is with the global +Y direction unless that would result in an invalid alignment in which case +Z is used
 - Note: In the ANSYS Classic Environment, the cross section lies in the YZ plane and uses the X direction as the edge tangent. This difference in orientation has no bearing on the analysis.

Cross Section Alignment

A color code is used to indicate cross section status for line bodies in the Viewer

- Violet: no cross section assigned
- Black: cross section assigned with valid alignment
- Red: cross section assigned with invalid alignment

The line body icons in the tree have similar visual aids

- Green: cross section assigned with valid cross section alignment
- Yellow: no cross section assigned or default alignment
- Red: invalid cross section alignment

Cross Section Alignment

Checking alignment can be done graphically using the View menu

- Choose “Show Cross Section Alignments”
 - Green arrow = +Y, blue arrow = edge tangent of cross section
- Or choose “Cross Section Solids”

Cross Section Alignment

- Because a default alignment is chosen, Cross Section orientation will almost always need to be modified
- There are 2 methods for modifying the Cross section alignment, “Selection” and “Vector”
 - The selection method uses existing geometry (edges, points, etc.) as alignment reference
 - The vector method uses input according to X, Y, Z coordinate directions
 - For either method a rotation angle can be input and/or the orientation reversed

Selection Method

Line-Body Edge	
Alignment Mode	Selection
Cross Section Alignment	None (+Z by default)
Alignment X	0
Alignment Y	0
Alignment Z	1
Rotate	0 °
Reverse Orientation?	No

Vector Method

Line-Body Edge	
Alignment Mode	Vector
Cross Section Alignment	Vector
Alignment X	0
Alignment Y	0
Alignment Z	1
Rotate	0 °
Reverse Orientation?	No

- To access the Alignment Mode Details, click on the Line Body in the Tree
- RMB in the Viewer and Choose “Select All”
- Alignment Mode details show up

Cross Section Alignment

Modifying the Cross Section orientation by vector

Switch to “Vector” alignment mode

Enter the desired coordinate values

Enter rotation angle if desired

Reverse orientation if desired

Line-Body Edge

Alignment Mode	Vector
Cross Section Alignment	Vector
Alignment X	0
Alignment Y	1
Alignment Z	0
Rotate	0 °
Reverse Orientation?	No

Line-Body Edge

Alignment Mode	Vector
Cross Section Alignment	Vector
Alignment X	0
Alignment Y	1
Alignment Z	0
Rotate	30 °
Reverse Orientation?	No

Cross Section Alignment

Modifying the cross section orientation by selection

1. Select the line body to be aligned in graphics window

2. With "Selection" method active click in the alignment field

3. Select the geometry to be used for alignment

Cross Section Alignment

Alignment using lines or axes

Line chosen for alignment

Axis chosen for alignment

Cross Section Alignment

Alignment using face normal

Cross Section Alignment

Alignment using sketch points

Note: The order of point selection determines cross section alignment

Cross Section Offset

Cross Section Offset

- After assigning a cross section to a line body, the Detail property allows users to specify the type of offset to use with the cross section:
 - Centroid: The cross section is centered on the line body according to its centroid (default)
 - Shear Center: The cross section is centered on the line body according to its shear center
 - Note the graphical display for centroid and shear center appear the same however. When analyzed, the shear center is used
 - Origin: The cross section is not offset and is taken exactly as it appears in its sketch
 - User Defined: User specifies cross section's X and Y offsets

Cross Section Offset

**Line Body with
cross section
displayed**

**Origin offset
(no offset)**

Line Body

**Centroid/Shear
Center offset**
