

**Do you think technology is a threat to
man's existence?**

Professional Career Development

Since the beginning, man has been afraid of evolution, but fear does not prevent us from evolving. We started with the discovery of the fire, later we had invented the wheel and thus we evolved through the invention of mechanisms that facilitated our day to day life and thus robotics was invented, that is, technology. In this way, Artificial Intelligence (AI) arrived in our lives and especially in our workplaces, evolving very fast and simplifying our lives in such a way and occupying several places that were previously jobs of human beings that we now think of the danger of being replaced literally by the machines and in order to avoid this, how can we follow this evolution in order not to be discarded as outdated objects.

First of all, we need to remember that technology was invented to make our lives easier and not to make it harder, however it all depends on how we are going to use this artificial intelligence, so “this is less about technological innovation and more about the manner in which humans decide to use that technology”. Examples of how technology is not a threat to human beings and that it all depends on how we use this technology is the invention of the car, which made our lives much easier and made our travels much easier, however people die every day due to white drivers or by excessive speed, self-checkout was invented to reduce the number of hours in queues, however there are people who take advantage of the absence of sellers to serve and they steal products, so the danger is not the machine, but the man.

We can say that technological evolution leads to the evolution of society and consequently to the increase in urbanization areas and thus

our needs change and the needs of companies too, as they want to produce more and more efficiently and ecologically. With this increase in urbanized spaces and concerns more about producing and protecting the environment, new jobs focused on alternative energies and ways of reusing energy will be created and this is one of the positive points of technology.

However, technological evolution will not be positive for everyone, as generations that have become accustomed to sending letters and using other means of communication, when faced with a computer, do not know how to react, and end up being digitally excluded because they are unable to adapt to changes, and this is the great danger so in order to combat this problem, we will have to learn new skills, which implies not stopping studying and trying to understand technologies more and more without any fear.

In short, new technologies are not a threat to men but an advantage because they are created in order to make our lives easier and in this way we as a society evolve. The big problem is in the way we use them and our ability to adapt. In this way, we must increase our skills and focus more on studies/professions related to technologies so this way we will not be digitally excluded.
