Introduction

This application was created as a way for people who suffer from any form of illness or lifelong disease to help manage and control either for a period of time or for life while also being useful in an emergency situation should something such as a seizure happen. The aim of the application is to provide people with illness an easy and effective way to manage their health using just their Apple device!

Findings:

The graph below from Google trends shows that this is something people are interested in and that there is a steady increase in demand for such an application as more and more people are searching for such an app.

After seeing the demand for such an application I then researched how many people could actually download the app (78.29 Mil as of 2016) to ensure that there was a high demand and large market for the application.

Description

The application MedMe will hold data such as:

- Name.
- Age.
- Sex
- Illness.
- Medication/Reminder.
- Next of kin contact details.
- Last known incident and details.

The application will be made in XCode using the Apple made language Swift 3 and a database made on Phpmyadmin to store user details.

The target audience is anyone who has an illness and an Apple device. The application could even be used by parents of children who are too young to use or own an Apple device.

The application will allow the user to not only store the above data but in the event of an emergency will allow anyone to access the chosen information with the use of a button on the lock screen which will allow not only paramedics but anyone who will help access to the above information.

Outcome

The expected outcome should result in a fully functioning mobile application that can help the user manage their illness or disease for as long as they need it. This will provide an efficient and easy way for Apple users to monitor not only their health but that of family members who are unable to use the application themselves by downloading it on their mobile device instead. When this outcome is met the application has huge potential in not only preventing possible health incidents but through the emergency feature it could even save many lives all across the world that would be the ideal goal of this application called MedMe.
