So far

- Understand the concept – DBMS
- Identify different types of databases
- Components of DBMS
- DBMS system Architecture
- Relational Keys
- Implementation using MS Access

Recap of Keys

<https://vevox.app/#/m/108476373>

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A university database has a table named Students with columns StudentID, FirstName, LastName, and Email. The StudentID is a unique identifier assigned to each student.

Question: Which of the following can be considered a Primary Key for the Students table?

- A) FirstName
- B) Email
- C) StudentID
- D) Combination of FirstName and LastName

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A university database has a table named Students with columns StudentID, FirstName, LastName, and Email. The StudentID is a unique identifier assigned to each student.

Question: Which of the following can be considered a Primary Key for the Students table?

A) FirstName

B) Email

C) StudentID

D) Combination of FirstName and LastName

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: In the Employees table, there are columns: EmployeeID, SSN, FirstName, LastName, and Email. Both EmployeeID and SSN are unique for every employee.

Question: Which of the following is not a Candidate Key for the Employees table?

- A) EmployeeID
- B) SSN
- C) Salary
- D) Both A and B

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: In the Employees table, there are columns:

EmployeeID, SSN, FirstName, LastName, and Email. Both EmployeeID and SSN are unique for every employee.

Question: Which of the following is not a Candidate Key for the Employees table?

A) EmployeeID

B) SSN

C) Salary

D) Both A and B

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A library database has a Books table with columns BookID, ISBN, Title, and Author. The BookID is an automatically generated unique identifier, and ISBN is the unique identifier for each published book.

What can be said about the keys in this table?

- A) Both BookID and ISBN are primary keys.
- B) Only ISBN can be the primary key, as it's unique for each book.
- C) Both BookID and ISBN are candidate keys, but only one can be chosen as the primary key.
- D) Title should be the primary key because it's the most important piece of information.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A library database has a Books table with columns BookID, ISBN, Title, and Author. The BookID is an automatically generated unique identifier, and ISBN is the unique identifier for each published book.

What can be said about the keys in this table?

A) Both BookID and ISBN are primary keys.

B) Only ISBN can be the primary key, as it's unique for each book.

C) Both BookID and ISBN are candidate keys, but only one can be chosen as the primary key.

D) Title should be the primary key because it's the most important piece of information.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

In a school database, the Students table has columns StudentID, FirstName, LastName, Email, and NationalID. The StudentID is a unique identifier auto-generated by the system, and the NationalID is unique for each student as well. Which of the following is the best choice for the primary key?

- A) FirstName and LastName combined.
- B) Email because it's unique.
- C) Either StudentID or NationalID can be selected as the primary key.
- D) FirstName should be the primary key.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

In a school database, the Students table has columns StudentID, FirstName, LastName, Email, and NationalID. The StudentID is a unique identifier auto-generated by the system, and the NationalID is unique for each student as well. Which of the following is the best choice for the primary key?

- A) FirstName and LastName combined.
- B) Email because it's unique.
- C) Either StudentID or NationalID can be selected as the primary key.**
- D) FirstName should be the primary key.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A university database has two tables: Students and Courses. The Students table has StudentID as its Primary Key, and the Courses table has CourseID as its Primary Key. There's a third table called Enrolments which records which students are enrolled in which courses.

Question: In the Enrolments table, which of the following should be used as a Foreign Key?

- A) StudentID
- B) CourseID
- C) Both A and B
- D) Neither A nor B

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A university database has two tables: Students and Courses. The Students table has StudentID as its Primary Key, and the Courses table has CourseID as its Primary Key. There's a third table called Enrolments which records which students are enrolled in which courses.

Question: In the Enrolments table, which of the following should be used as a Foreign Key?

- A) StudentID
- B) CourseID
- C) Both A and B**
- D) Neither A nor B

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A table ProjectAssignments has columns: EmployeeID, ProjectID, and AssignmentDate. One employee can be assigned to multiple projects, and each project can have multiple employees.

Question: Which of the following is the best Composite Key for the ProjectAssignments table?

- A) EmployeeID
- B) ProjectID
- C) Combination of EmployeeID and ProjectID
- D) AssignmentDate

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

Scenario: A table ProjectAssignments has columns: EmployeeID, ProjectID, and AssignmentDate. One employee can be assigned to multiple projects, and each project can have multiple employees.

Question: Which of the following is the best Composite Key for the ProjectAssignments table?

A) EmployeeID

B) ProjectID

C) Combination of EmployeeID and ProjectID

D) AssignmentDate

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A table called Orders has the following columns: OrderID, CustomerID, ProductID, and OrderDate. The OrderID uniquely identifies each order, while both CustomerID and ProductID are required to uniquely identify an ordered product by a customer. What is the best key configuration for this table?

- A) OrderID should be the primary key.
- B) CustomerID should be the primary key.
- C) A composite key of CustomerID and ProductID should be the primary key.
- D) OrderDate should be included in the composite key.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A table called Orders has the following columns: OrderID, CustomerID, ProductID, and OrderDate. The OrderID uniquely identifies each order, while both CustomerID and ProductID are required to uniquely identify an ordered product by a customer. What is the best key configuration for this table?

- A) OrderID should be the primary key.**
- B) CustomerID should be the primary key.
- C) A composite key of CustomerID and ProductID should be the primary key.
- D) OrderDate should be included in the composite key.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A table StudentCourses stores which courses students are enrolled in, with the columns StudentID, CourseID, EnrollmentDate, and Grade. Each student can enroll in multiple courses, and each course can have multiple students. What is the best key configuration?

- A) StudentID should be the primary key.
- B) CourseID should be the primary key.
- C) A composite key of StudentID and CourseID should be the primary key.
- D) EnrollmentDate should be the primary key.

Quiz

Primary Key, Candidate Key, Foreign Key, & Composite Key

A table StudentCourses stores which courses students are enrolled in, with the columns StudentID, CourseID, EnrollmentDate, and Grade. Each student can enroll in multiple courses, and each course can have multiple students. What is the best key configuration?

A) StudentID should be the primary key.

B) CourseID should be the primary key.

C) A composite key of StudentID and CourseID should be the primary key.

D) EnrollmentDate should be the primary key.

Today's lesson

- **Entity, Entity Set**
- **Kinds of Entities**
- **Types of Attributes**
- **Types of Relationships**
- **Mapping of ERD to tables**

Database Design Process

E-R Data Model

- **Three** principal element types:

Entity

- Entity-abstract object of some sort
- Entity Sets-a collection of similar entities

Attributes

- Properties of the entities in that set
- Assumptions: attributes are of primitive types, such as strings, integers, or real numbers

Relationships

- Connections among two or more entity sets

Entity, Entity Set and Entity Type

An **entity** is an object in the real world with an independent existence that can be differentiated from other objects. An entity might be

- An object with physical existence (e.g., a lecturer, a student, a car)
- An object with conceptual existence (e.g., a course, a job, a position)

Entity

Objects in real life that are distinguishable from other objects.

Usually nouns in a scenario description but not every noun becomes an entity – think carefully when you finalize on the entities

Question: If you are building a data model for a **small retail store**, then the potential entities may be ?

Entity

- If you are building a data model for a small retail store, then the potential entities may be
 - Products
 - Suppliers
 - Customers
 - Employees
 - Inventory
 - Orders
 - Promotions/Discounts

Entity, Entity Set

An **entity set** is a collection of entities of an entity type at a particular point of time. In an entity relationship diagram (ERD), an entity type is represented by a name in a box. For example, the entity is EMPLOYEE.

EmployeeID	FirstName	LastName	DateOfBirth	Gender	Position	Department
1	John	Doe	1985-06-15	Male	Software Dev	IT
2	Jane	Smith	1990-09-20	Female	Data Analyst	IT
3	Mike	Brown	1988-12-05	Male	HR Manager	Human Resources
4	Emily	Davis	1992-02-10	Female	Accountant	Finance
5	David	Wilson	1983-11-25	Male	Project Manager	Operations

Entity – Notation

- **Entity Instance:** Values associated with the entities. (rows in the table at a given point in time)

Notation: *rectangle* labelled with the name of the entity.

Notation for an Entity

Identify the Entity & entity sets from the data below;

Movie

MovieID	Title	ReleaseDate	Duration	Rating	GenreID	DirectorID
1	Inception	2010-07-16	148	8.8	1	1
2	The Dark Knight	2008-07-18	152	9.0	2	1
3	Interstellar	2014-11-07	169	8.6	1	1
4	Titanic	1997-12-19	195	7.8	3	2

Actor

ActorID	FirstName	LastName	DateOfBirth	Nationality
1	Leonardo	DiCaprio	1974-11-11	American
2	Joseph	Gordon-Levitt	1981-02-17	American
3	Ellen	Page	1987-02-21	Canadian
4	Christian	Bale	1974-01-30	British
5	Kate	Winslet	1975-10-05	British

Kinds of Entities

You should also be familiar with different kinds of entities including independent entities, dependent entities and characteristic entities. These are described below.

Types of Entities

Regular Entities

- Called as Strong Entities.
- Independent Entities
- E.g. Employee

Weak Entities

- Its existence depends on some other entity
- E.g. EmployeeDependants
- If an Employee Instance is deleted, then the dependants too are deleted. They do not exist without the employee.

Notation for a Regular Entity

Employee

Notation for a Weak Entity

EmpDependant

Regular and Weak Entities

Example Data:

Student Table:

StudentID	FirstName	LastName	DateOfBirth	Email
1	John	Doe	2000-01-15	john.doe@example.com
2	Jane	Smith	1999-03-22	jane.smith@example.com

Course Table:

CourseID	CourseName	Credits	Department
101	Database Systems	4	Computer Science
102	Calculus I	3	Mathematics

Enrollment Table:

StudentID	CourseID	EnrollmentDate	Grade
1	101	2023-09-01	A
2	101	2023-09-01	B
1	102	2023-09-01	A-

Entities - Examples

Employees

Dependents

Faculty

Evaluations

Knowledge Check - Entities

<https://forms.office.com/e/KGnQsAxqmt>

Attributes

In the entity, shown below, what are the attributes that define 'Employee' entity?

Attributes

In the entity relationship diagram, shown below, each attribute is represented by an oval with a name inside.

Attribute Types

- Each entity has attributes – **properties that describe it.**
- A particular entity will have values for its attributes.
- E.g. an employee entity may have name, age, home address, home phone etc as their attributes.

Attribute Types			
Simple vs Composite	Single vs Multivalued	Stored vs Derived	Null vs Complex

Attributes Notation

- **Attribute Domain:** The set of allowable values for one or more attributes.
- Each attribute is associated with a set of values.
- **Notation:** Attributes are represented by ovals.

Notation for an Attribute

Notation for a **Key** Attribute

Attribute Types - 1

Type	Description	Example
Simple Attribute 	An attribute composed of a single component with an independent existence. Also called as atomic attributes.	Employee entity: Position, salary etc.
Composite Attribute 	An attribute composed of multiple components, each with an independent existence.	Employee entity: Address → can be made up of <i>street, town, country, postcode</i>

Attribute Types - 2

Type	Description	Example
Single Valued Attribute 	An attribute that holds a single value for each occurrence of an entity type.	Employee entity: Salary → can be only one value. Cannot draw more than one salary.
Multi Valued Attribute 	An attribute that holds multiple values for each occurrence of an entity type.	Employee entity: PhoneNo → A person can have one or more mobile phone number, landline etc.

Attribute Types - 3

Type	Description	Example
Stored Attribute 	An attribute that holds a value provided as is.	Employee entity: Name → can be set by the user as used as is.
Derived Attribute 	An attribute that represents a value that is derivable from the value of a related attribute or set of attributes, not necessarily in the same entity type.	Employee entity: Age → can be derived from dateOfBirth and currentDate.

Attribute Types - 4

Type	Description	Example
NULL Attribute 	An attribute that means either the value is unknown or inapplicable. It does not mean zero.	Employee entity: Commission → can be NULL
Complex Attribute 	An attribute that is formed by nesting composite attributes and multi-valued attributes in arbitrary way. We can say this as the both are in the attribute.	Employee entity: A person can have many phone numbers, many e-mail addresses, home addresses etc. So, if there is an attribute in the name of 'Contact detail', it can be a complex attribute.

Nulls

Example of how null can be used

Use the Salary table (Salary_tbl) to follow an example of how null can be used.

Salary_tbl

emp#	jobName	salary	commission
E10	Sales	12500	32090
E11	Null	25000	8000
E12	Sales	44000	0
E13	Sales	44000	Null

Knowledge Check: Attributes

<https://forms.office.com/e/EkZ8AhrXAx>

Entity, Attributes & Relationship

Entity, Attributes & Relationship

- Identify the entities, attributes and possible relation for simple University Database and represent it in ERD

Entity & Attributes

Entity & Attributes

What are the relationships that link the tables?

Relationships

What are the relationships that link the tables?

Relationships

Which one is possibly true?

- a) One student enrolls to One course
- b) One student enrolls to many courses
- c) Many students enrol in many courses

Relationships

Which one is possibly true?

- a) One student enrolls to One course
- b) One student enrolls to many courses
- c) **Many students enrol in many courses**

Relationships

Which one is possibly true?

- a) One student enrolls to One course
- b) One student enrolls to many courses
- c) **Many students enrol in many courses**

Relationships- Manager & Department

What is the relationship?

Relationships- Manager & Department

Which one is possibly true?

- a) each manager is assigned to exactly one department
- b) Many managers are assigned to one department

Relationships- Manager & Department

Which one is possibly true?

- a) **each manager is assigned to exactly one department**
- b) Many managers are assigned to one department

Relationships- Manager & Department

Which one is possibly true?

- a) **each manager is assigned to exactly one department**
- b) Many managers are assigned to one department

Relationships- Customer & Order

Identify the possible relationship between customer and order

Relationships- Customer & Order

Which one is possibly true?

- A customer can place multiple orders
- A customer can place only one order

Relationships- Customer & Order

Which one is possibly true?

- **A customer can place multiple orders**
- A customer can place only one order

Relationships- Customer & Order

Which one is possibly true?

- **A customer can place multiple orders**
- A customer can place only one order

Relationships- Notations in ERD

Knowledge Check - Relationships

A school has students, and each student is assigned one locker. Each locker is assigned to only one student.

What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A school has students, and each student is assigned one locker. Each locker is assigned to only one student.

What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A company has employees and departments. Each employee is assigned to exactly one department, but each department can have many employees. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A company has employees and departments. Each employee is assigned to exactly one department, but each department can have many employees. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A university has courses and students. Each student can enrol in multiple courses, and each course can have multiple students enrolled. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A university has courses and students. Each student can enrol in multiple courses, and each course can have multiple students enrolled. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) **Many-to-Many**

Knowledge Check - Relationships

A library has books, and each book has a unique ISBN. Each ISBN is assigned to only one book. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A library has books and each book has a unique ISBN. Each ISBN is assigned to only one book. What type of relationship is this?

- A) **One-to-One**
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A hospital has patients and doctors. Each patient can be treated by multiple doctors, and each doctor can treat multiple patients. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A hospital has patients and doctors. Each patient can be treated by multiple doctors, and each doctor can treat multiple patients. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) **Many-to-Many**

Knowledge Check - Relationships

A school has classes and teachers. Each class is assigned one teacher, but each teacher can teach multiple classes. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A school has classes and teachers. Each class is assigned one teacher, but each teacher can teach multiple classes. What type of relationship is this?

- A) One-to-One
- B) **One-to-Many**
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A music streaming service has playlists and songs. Each playlist can contain multiple songs, and each song can appear in multiple playlists. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) Many-to-Many

Knowledge Check - Relationships

A music streaming service has playlists and songs. Each playlist can contain multiple songs, and each song can appear in multiple playlists. What type of relationship is this?

- A) One-to-One
- B) One-to-Many
- C) Many-to-One
- D) **Many-to-Many**

A car rental company keeps track of its customers, the cars they rent, and any accidents that occur during the rental period.
