

Taking the synchronic approach to evidence in historic landscape assessments: a
Welsh case study of 19th century place-names.

Shelley Williams

Dissertation submitted in partial fulfilment

University of Wales Trinity Saint David

May 2018

Abstract

The concerns of using later historical evidence to reconstruct earlier landscape arrangements have always been felt, particularly by historical geographers and landscape historians who use such approaches. The aim of this paper is to consider whether such methods can be more reliable if a synchronic approach to the evidence is taken, tested by the study of field names from the 19th century Tithe Apportionment Survey.

Introduction

The aim of this paper is to consider whether a synchronic approach to the study of field names can be successfully deployed, to identify clues or signposts that an archaeologist or historian can use as a route to further profitable historical enquiry. This approach is put forward as a response to situations where historical evidence contemporary with the period under study is not available, or the contemporary material is unsuitable due to compatibility issues of locality, both of which arise when using a historical geographical approach to the study of historic landscapes.

The first section of the report will give background information on the approach of historical geographers, particularly in Wales, and some of the methodological problems that have been debated. We will also look at current toponymy studies, and how the study of place names might be approached from the disciplines of archaeology and history. It will be explained how this might be demonstrated via a study of field names from the 19th century Tithe Apportionment Schedules and associated maps.

To meet the aims of this study, the first objective was to compile a suitable list of place names from the tithe survey and to appropriately analyse the list of names to attempt to identify distinctive structures or rules. The second objective was to identify where any outliers to the general structures might be found, which would offer the opportunity for investigation.

The second section of the report will set out in detail the methods used, and this will be followed by the full set of results and a discussion around the success or otherwise of the study.

Historical Geography and Landscape History in Wales.

The antiquarian act of collecting, ordering, classifying and categorising people, objects, and places, continued into the early and mid-twentieth century within the culture-historical approach of history and archaeology (Johnson 2010). Landscape studies during this period was the preserve of the historian with a keen interest on the rural countryside, for example Maitland's *Domesday Book and Beyond* (1897 cited in Rippon 2009), and Fox's *The personality of Britain* (1932) where he characterises a Britain of two parts, of the upland and lowland.

During the 1920's to the 1940's Sir Cyril Fox was keeper of the archaeology collection at the National Museum of Wales. Together with his wife, the prominent Roman and Prehistoric archaeologist Lady Aileen Fox, they carried out important historical and archaeological studies in Wales. Perhaps one of the most well documented is the work carried out by Aileen Fox in the South Wales uplands, (for example see Fox 1939). Much of their work documented and characterised the medieval platform sites across the Glamorgan and South Wales rural uplands, shaping the idea of an historic rural Wales and in the process making a distinction between the remote upland Welshry and the lowland Englishry (Bezant 2016).

Sir Cyril Fox was to forge an important relationship with Sir Iorwerth Peate, together founding the Welsh Folk Museum at St. Fagan's near Cardiff. The museum was based on the pioneering *Skansen* model, which prompted the tradition for the open air folk museum to spread across Europe during the late 19th and early 20th centuries. Much like the idea of upland and lowland in Fox's earlier work, the museum considered the rural Welsh speaking Wales as more authentic than the English speaking industrial heartlands, and thus the collection reflected this outlook (Mason 2004: 22).

In using the Medieval Welsh Law codes as evidence, Peate connected the idea of the Medieval Welsh longhouse with Neolithic structures, allowing him to correlate such structures and give them a shared Celtic tradition (Bezant 2016). A prominent nationalist, poet and historian, Peate studied at Aberystwyth University under the

professorship of H.J. Fleure who introduced the new school of Geography to the university in the 1920's (NLW, n.d.).

There was increased fervour in the areas of historical geography and landscape history during the middle of the 20th century. Seminal works were published by the 1950's such as Hoskin's *The Making of the English Countryside* (1955). At this time at Aberystwyth University, thanks to the influence of Fleure, a tradition had been established that study should focus on Welsh interests in the local environment and countryside. And this was not just in historical studies, local community studies produced work such as A.D. Rees (1996) *Life in a Welsh Countryside*. We find in this work that the author regularly compares the social and cultural behaviours of the modern Welsh community he was studying, with those supposed to be of Medieval Wales (Rees 1996: 81). It was around this time that T. Jones Pierce joined Aberystwyth University to teach Medieval History and began supervising Glanville Jones (NLW, n.d.).

In the emerging field of British Medieval Archaeology, interest moved to the deserted village sites of England. The '*Field Survey Tradition*' began in earnest in the 1960's, and in the following decade integrated approaches and methods were used and developed, allowing the study of the landscape at ever larger scales. The matured approach is outlined in Aston's (1985) *Interpreting the Landscape* (Rippon 2009: 230), where in his first chapter he outlines what he sees as the five main categories of information which provide the evidence needed to compile a landscape history. These are archaeology, aerial photography, maps, local history, and related studies (Aston 1985: 13).

However historical geographers concerned with Wales continued studying landscape organisation, and influenced by T. Jones Pierce, Glanville Jones focussed on questions of Welsh settlement and territory. He challenged the established paradigm of an early Welsh Medieval society based on a pastoral economy of travelling freemen in a tribal structure. Instead, he argued that Wales was more likely to have been a society where settlement was far more common, with nucleated settlements and open-field systems maintained by an unfree population (for an example see Jones: 1963).

Much of this work was based on documentary evidence from the Welsh Law texts and rent rolls dated from the late Medieval period, an approach which has been identified by historians, geographers and archaeologists as problematic for several reasons. One such concern is the applicability of later evidence when used in the discussion of earlier periods. It must be accepted that the surviving copies of the Welsh Law texts written in the later medieval period reflect the laws of 500 years before. It must be accepted that that these are valid evidence strands for addressing questions of the early Medieval period to accept the theses put forward. Another concern is discussing Welsh settlement and territory in terms that are based on evidence from North Wales. For example, South Wales was under strong Norman influence from the 12th century onwards and is likely to have had different arrangements, territorially, socially and politically to those reflected in the rent rolls of North Wales (Jones 1998; Davies 1982: 43-47; Davies 1990: 92; Griffiths 1998; Seaman 2012).

In his later work, Jones developed the '*multiple estate model*', as a means of identifying what he believes are early British estate structures that perhaps originated in the pre-Roman, or Celtic, era. Criticisms include the accusation that the model is used normatively, is ambiguous in its definition, and the model would require detailed empirical work to test its suitability (Gregson 1985). They were criticisms Jones himself defended robustly (Jones 1985). Others have been less fatalistic in their assessments, and have concluded that the model remains useful, albeit having to acknowledge and address the problematic elements (Hadley 1996; Bezant 2009).

It is true then that there are problems in the historical geographical approach to landscape studies in Wales. The main issue discussed here is the reliability of the documentary evidence used, and the two main problems this creates. The first problem identified is that the evidence used in Jones' approach has a north Wales bias, part of the reason perhaps, as we have highlighted above, that the influencers in the early and mid-20th century were promoting the narrative that authentic Wales was the rural Welsh speaking Wales.

It then becomes reasonable that should a study of the landscape arrangements is to be carried out using this approach, the evidence should be regionally or locally relevant. The tithe survey of the early 19th century is one such historical source. Each parish across wales would have been surveyed, mapped and drawn, and each parcel of land measured and recorded by name, ownership and usage. Local knowledge on the landscape was retained using local surveyors (Pearson & Collier 1998: 164).

This however does not address the second problem, which is the reliability of using historical data sources in landscape studies, where later sources are used to say something of the past. The tithe maps are an excellent source of information on 19th century farming, and some people have done local studies on such, being reasonably confident that the landscape arrangements seen on the maps are reasonably close to what was on the ground, albeit with some caveats (Pearson & Collier 1998). But the reliability of using the maps remains a problem if we want to suggest arrangements for an earlier period, such as the Medieval.

Of course, if we were advocating an archaeological approach in the *field survey tradition* as outlined above, then we could engage in other methods and use the other information sources to compile additional evidence strands, which would result in a more robust, and therefore acceptable interpretation of the landscape.

It is also worth looking at alternative ways to interrogate the evidence within the source, either separate from the spatial elements, or in compliment to. This can be found in the field names. They are an information source that can tell us much about the landscape yet can be separated from the spatial and physical limits as set on the map. They can give clues not only to present day land use but can also contain clues as to what was there in the past.

Place Name Studies

Established approaches in toponymy have been diachronic in nature, studying semantics, etymology, and the historic development of place names (Condera et al. 2007). Some scholars see this tradition as a continuation of the antiquarian tradition of collecting in the search for the origins and meaning behind toponyms.

Toponymy in Wales is found much in the traditional setting of gazetteers and lists, and most of the work is found in the form of university theses, the majority of which was written in the early 20th century and can be difficult to access (Wmffre 2004).

Published in three volumes, *The Place-names of Cardiganshire* by Wmffre (2004) is the most recent and contains a catalogue of 15,000 place-names. Although field names, or micro toponyms, are not included, the author explains that they have not really featured in any notable way in scholarly work to date, not perhaps considered as important as the names of settlements and natural features. Only those deemed as important etymologically tend to be included, rather than for any historic interest (ibid, p.xxviii).

Internationally, there has been a critical turn in place-name studies, one that questions the traditional approaches and instead looks to the politics behind place names instead of only concentrating on their functional use (Rose-Redwood et al. 2010). Some advocate a synchronic approach, which views the evidence as being at a fixed point in time, removing any historical baggage (Condera et al. 2007). The synchronic approach is perhaps at first glance not helpful to archaeologists and historians, who seek to use place-name evidence to build a picture of the past. But if we consider the two approaches more carefully, it seems that it might be a useful way to overcome some of the methodological issues associated with using the evidence.

The diachronic approach in toponymy and wider linguistics is historical in nature, having the intention of showing how languages, or in the case of toponymy place names, have changed or evolved over time. If the place name of the toponymist is analogously replaced with the acre of land of the landscape historian, in this instance a diachronic analysis would set out to find out how the value and therefore use of that land has changed through time. But much like an archaeologist must avoid the common methodological pitfalls of working with the limited and partial evidence base that is the archaeological record to provide a reasonable interpretation, equally so the toponymist must avoid the issues and challenges present in their own methods and approaches when considering language

development over time. This is not lost on archaeologists, of course, and as Aston points out:

“...as part of any landscape study, place names should be carefully collected, together with dates and sources of information.

Assessment and interpretation should only be attempted...with the help of an expert if the worst mistakes are to be avoided...” (Aston, 1985: 19)

The synchronic approach however deals with a fixed point in time. A synchronic place name study will perhaps look at the value of given place names to a social group today, by attempting to reveal the rules and structures that such naming conventions follow. The problems and difficulties of dealing with the historic are no longer there.

With regards to the acre of land analogy above, using this approach would not tell us anything meaningful about how the value of that parcel of land has changed historically up to this point, but it could perhaps determine how that parcel, and other similar parcels of land, are structured and interact with each other within the shared landscape as it is found today. In other words, it can reveal the structure and rules that exist today around land value and usage.

Perhaps this allows a different way to approach certain historical and archaeological questions, and to consider how place name evidence might be used in the suite of tools a landscape archaeologist or historian has available. I would suggest that unlike the toponymist, for whom the place name is central to the research itself, the landscape historian or archaeologist commonly sees the place name evidence as a small part of a much bigger picture, where it will sit alongside other evidence types which are perhaps seen as more tangible and more successful in interpretation, such as earthworks and artefacts. Perhaps then it is seen as a signpost to the historian which hints at but does not provide robust evidence of historic activity.

In terms of historical place name data, a synchronic approach would allow the structure of the names to be brought to light, through the methodical analysis of

each name. When certain rules and structures become apparent, it becomes easier for the archaeologist or historian to identify those names that fall out of the general orthodoxy that has been identified for that set of data, and thus said names become the signposts to the archaeologist to investigate further. It does not matter that the evidence maybe of a later date than the period under investigation.

If this is accepted, then it becomes perhaps permissible as a historian or archaeologist to engage in place name studies when the approach taken is a synchronic one. In such an approach the intention would not be to comment on the place names as objects themselves, but rather to use them as a helpful guide towards finding the more tangible and robust evidence that archaeologists and historians rely on.

Methods

The Classification of Data

To investigate the field names of the tithe survey, there needs to be a clear method of recording and processing, which will tease out the structures that may be present in the data. To do this the information should be appropriately classified, in which case an understanding of the basic structure of Welsh place names is perhaps a useful starting point.

At the most basic level, a place name can be said to be structurally simplex, made of one element, or a compound name, where there is more than one element. English place names tend to be compound names with two elements, where the first element, often an adjective, usually qualifies the second element. As seen in figure 1 below, Welsh place names are known as inverse compounds, where the adjective is the second element, and the first element is the qualified, often a topographical or habitative noun (Mills 2011: 17). In the case of field names (micro-toponyms) they differ in that they are far more distinctive to the local district that they appear (ibid). Using this basic structure seems to be a reasonable basis upon which to classify the different types of field names that appear in the list.

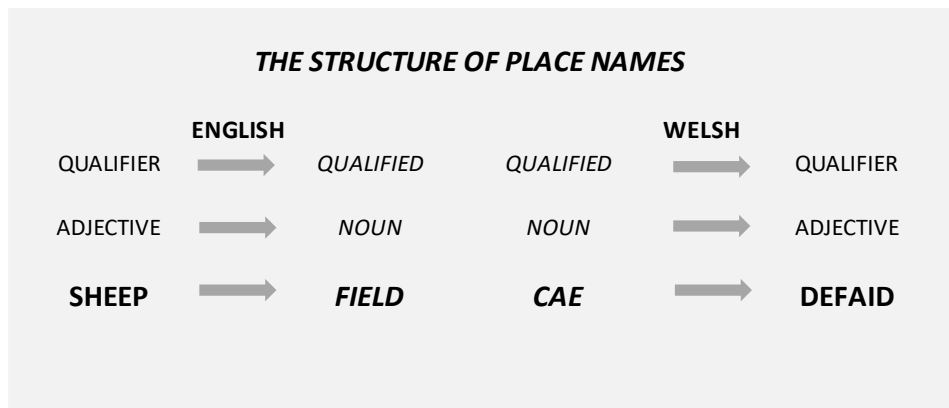

Figure 1: The structure of place names

The first level of classification chosen deals with the qualified nouns and has four options. The first option is labelled the '*physical descriptor*' (*PD*). Of the micro toponyms assigned to this category, the qualified noun relates to the physical and environmental characteristics of the landscape, that is descriptors such as moor, marsh, wood, meadow. These descriptors have been chosen as they can be broadly defined as types of landscape and relate closely to the use category on the tithe map (although not entirely as the language difference means that there are some exceptions). These descriptors were assigned the status of '*PDE*' for English micro toponyms and '*PDW*' for Welsh micro toponyms.

The second option in the first level of categorisation is '*unit descriptor*' (*UD*). This relates to any micro toponyms where the qualified noun is the conceptual organisation of the physical landscape. They are the general land units found in terms such as '*field*' and '*close*' in English and '*cae*' and '*crofft*' in Welsh. These descriptors were assigned '*UDE*' for English versions, and '*UDW*' for the Welsh versions.

It is possible to have a micro toponym which contains examples of both above options. For example, you might have a '*cae gwaun*' which would mean '*meadow/moor field*'. Clearly, both could fall into the two categories already outlined for the first stage, but in these instances the micro toponym is always

assigned a *UD* classification, such as would *‘field’* be in the example *‘sheep field’*, and the gwaun is relegated to qualifier status and categorised in the second classification.

The third option is *‘local and other descriptor’ (LOD)*. This classification is for the qualified nouns that are characteristically local in nature, often referring to the geological features, land conditions, and management practices that occur within or very local to the land parcel in question. These are assigned LODE for English micro toponyms and LODW for the Welsh equivalents.

The fourth option available in the first level of classification was for the data cleanse, called *‘out of scope’ (OS)*. This category housed all the entries from the tithe data which were not land parcels, mainly infrastructure such as churches, schools, and roads, and the micro toponyms which were deemed as untranslated. These entries were assigned ODE for English versions and ODW for Welsh versions.

Both the PD and UD descriptors went through a second phase of categorisation, narrowing down to individual types of each descriptor. See figure 2 below which demonstrates this.

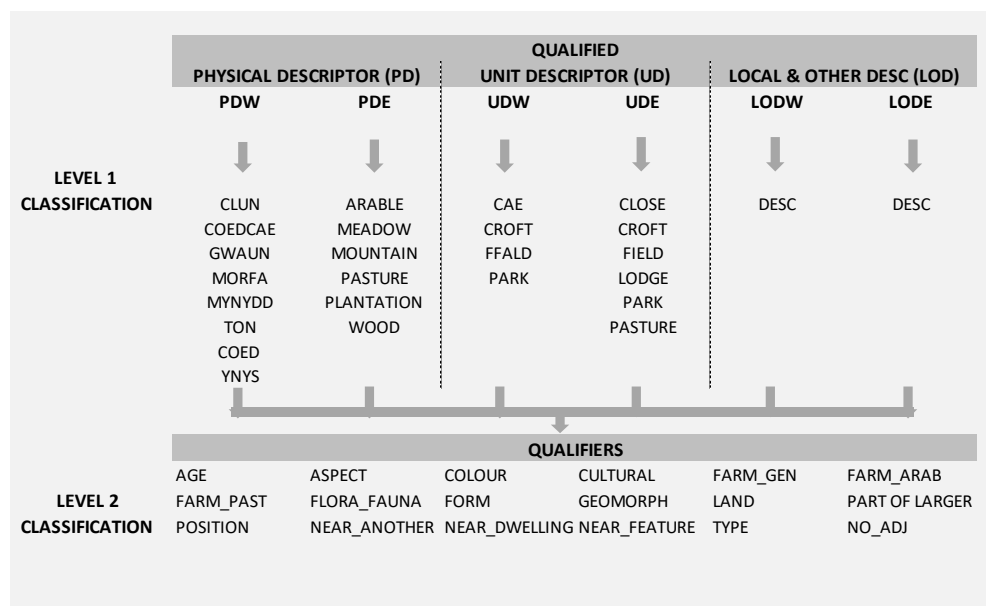

Figure 2: The classification process

The second level of classification is for the qualifiers, usually adjectives that describe some characteristic of the qualified, or noun, in the micro toponym. Generally, these fall into four groups. There are those which infer land use, for example relating to farming practices, or general resource usage. Then there are those which are geographic characteristics such as high and low fields, and the proximity to other features and land units. Thirdly there are those which describe physical characteristics and form of the land itself, such as shape, size, and land quality. Lastly there are those that are not adjectival in nature, and that infer cultural and social links to people, processes and things. Up to three further second classifications have been assigned to one micro toponym in some cases. As already discussed above, some level two classifications may be the same as level one, and this was expected by design. A full list of the level 2 classifications can be found in figure 3 below.

Level One - Qualified	
PDW	clun; coedcae; gwaun; morfa; mynydd; ton; wood; ynys;
PDE	arable; meadow; mountain; pasture; plantation; wood;
UDW	cae; croft; field; lodge; park; pasture;
LODW	desc;
LODE	desc;
Level 2 - Qualifiers	
AGE	reference to new; old; etc.
ASPECT	descriptions of bright, dark etc.
COLOUR	descriptions which infer colour, e.g. brown, red, green etc.
CULTURAL	descriptions which infer relationships to cultural features and people
FARM GEN	General farming related
FARM-ARABLE	arable farming related
FARM-PAST	pastoral farming related, including animals
FLORA-FAUNA	those related to wild flora and fauna, excludes farming
FORM	descriptions of size, shape, etc.
GEOMORPH	anything that relates to the geomorphological nature in or near the land parcel, e.g. hill, mountain etc.
LAND	descriptions of the land quality and substance
PART OF LARGER	Part of a larger named land unit
POSITION	anything related to location such as higher, lower, below etc.
PROXIMITY	Those that are stated to be near other named land parcels, dwellings, and other features.
TYPE	That which refers to the general type of landscape e.g. meadow, wood, etc.

Figure 3: List of classification types

Translation

In the translation of the Welsh into English, *Y geiriadur hanesyddol safonol Cymraeg* (The standard historical Welsh dictionary) was used. Owned and updated by the Centre for Advanced Celtic Studies at Aberystwyth University, it includes vocabulary from the earliest Old Welsh texts onwards. Any translation taken from elsewhere will be noted individually.

There are instances where certain words can produce more than one meaning, and in some cases, it depends entirely on the local situation as to which meaning is probable. In this study where there are words with more than one possible translation, the tithe map and 1st edition ordnance survey maps have been checked to get the best possible picture of the local conditions, and then the most likely translation has been chosen.

For example, '*du*' can mean black, or sable, or when used figuratively, a dark mood, or angry. The same word can also mean side. If we have a field name such as '*cae ty du*', it could be the black house field, or field of the black house (*Cae* = *field*; *ty* = *house*). But on checking a map and seeing it next to the house the obvious choice is the alternative meaning of side, 'field at the side of the house'.

Another example is '*pwll*'. This can mean pit, pool, or hollow as in a morphological landscape feature, or literally as in a stream pool, or even a mine, which is notable considering the survey area is beginning to become heavily industrialised with coal mines at this point in the 19th century. In these instances, the maps were consulted and interpreted as deemed appropriate to the evidence available. A sample list of translations for some of the more frequently encountered words can be found in Appendix 1. A full list of the translated field names can be found in Appendix 2.

Since the author is not a fully fluent Welsh speaker, there are some caveats that should be noted in terms of the translation process. All the translations have been made using the same source as described above, and all the translations have been made at the most basic of levels, as outlined in figure 1. It is hoped that by following these basic two rules, that if any mistakes are made, then they will be made consistently across the board, and therefore easily rectified if needed.

The general outcome of the micro toponym survey will be presented, displaying the trends for the entire survey area. Firstly, we will take a general overview and see what trends we can pick out from the first stage of classification. We will then look at the second stage of classification in a little more detail, as this is where the qualifying elements are categorised. We will then look at two of the parishes individually, one from each of the two valleys that are covered by this report, which will perhaps tease out some local variations.

The Tithe Maps

An area of South Wales was chosen, as it is an area the author knows and would therefore be familiar with the detail on the maps. The area that the Tithe maps are concerned with is that between the River Neath and the River Afan and is approximately 50 square miles. The parishes transcribed were Aberafan, Michaelstone Super Avan Lower, Baglan, Glyncorrwg, Glyncorrwg Blaengwrach, Resolven Clyne, and Llantwit Lower. Resolven Parish was not included as there are no field names included on the Tithe survey to transcribe. Michaelstone Super Avan was not included, as copyright permission to obtain copies of that schedule and map was unavailable at the time the others were collected.

Results

A total of 2832 entries were transcribed from the tithe lists and following the data cleanse as described in the methods section, 2070 usable micro toponyms remained. The majority removed were entries other than micro toponyms, only 2% of the entries removed from the sample were those micro toponyms where translation was not possible.

Classification Stage One

In total, 45% of all the micro toponyms were those from the '*Unit Descriptor*' category, with 42% of these assigned as Welsh and 3% assigned as English. There are 30% in the '*physical descriptor*' class, with the remaining 25% classified in the '*local and other descriptor*' category.

'Unit Descriptor' Class

With 45% of the micro toponyms assigned to the '*unit descriptor*', or *UD* classification, and 94% of these Welsh, this by far represents the largest type of Welsh micro toponym in terms of this study. Of how this is split amongst the parishes, it seems to correspond closely with the overall share total for each parish, suggesting a similar ratio of this type of micro toponym in each (see figure 4 for a breakdown of the Welsh examples compared with overall total share). Of the 864 Welsh examples, 806, or 93% are *cae* (field) examples. The remaining 7% is made up of *croft* (little field) at 4%, *ffald* (fold) at 1% and *parka* (park) at 2%.

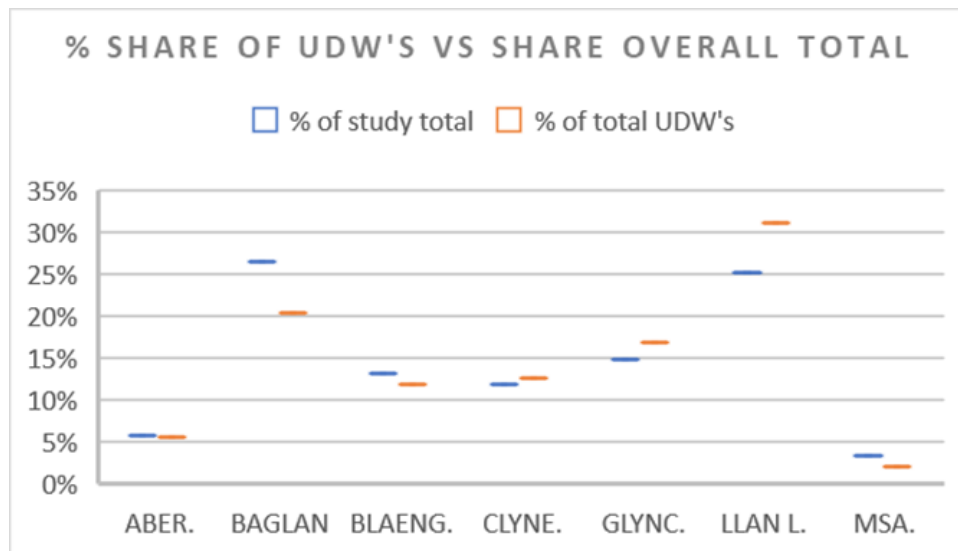

Figure 4: Breakdown of unit descriptor class

The highest number of qualifiers for *cae* examples are those which relate to position. Accounting for 18% of the *total*, they include those which relate the position of a field to differentiate from those that may be similar around them, for example *cae ishaf* (lower field), *cae uchaf* (higher field), and *cae cenol* (middle field). Equal in number are those which account for the position of the field in relation to the house and other features around the farm such as a barn or road, for example *cae uwchlawrty* (field above/beyond the house) which means combined they make up one third of all *cae* qualifiers.

With 14% of the total number of *cae* qualifiers, are those that make inferences to the *form* of the land parcel. References to size include *mawr* (big) and *bach* (small), with these accounting for 40% of the total *form* classification. References to shape include *main* (narrow) and finally there are references to slope and surface, for example *tyle* (steep). A full breakdown of *cae* qualifiers is shown in figure 5 below.

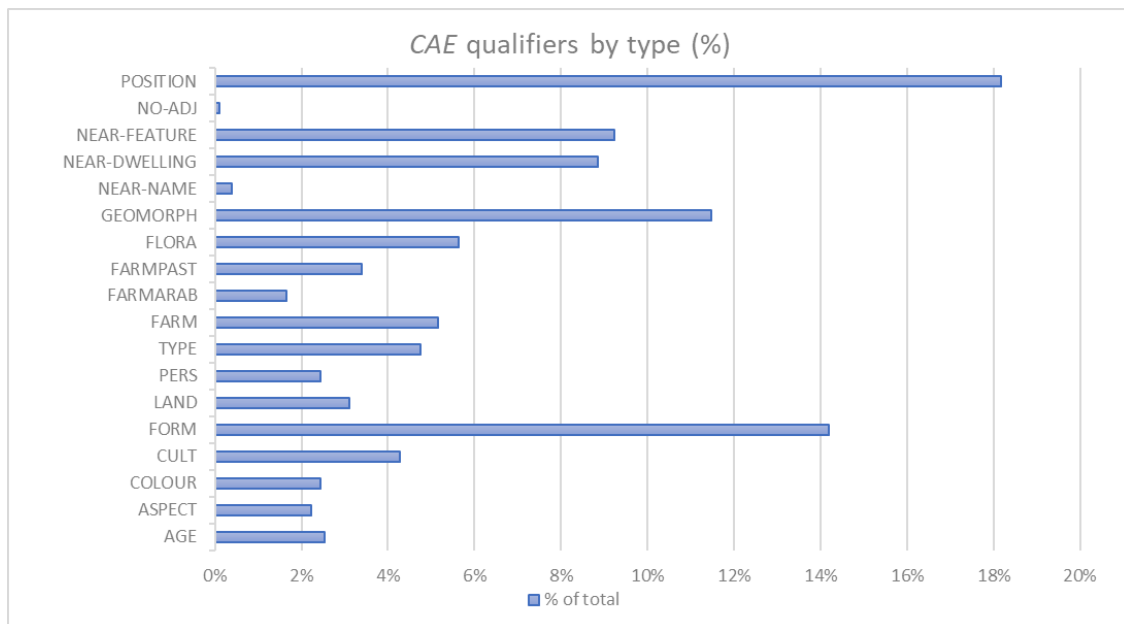

Figure 5: Cae qualifiers by type

The *cae* qualifiers ascribed the *cultural* class make up just 4% of the total with 37 events. One third of these is found in Llantwit Lower Parish, but with a quarter of field names in the survey from here, this perhaps is not surprising. More notable is the Aberavon Parish share of the *cultural* qualifiers at 25% of the total.

'Physical Descriptor' Class

This class contains 30% of the total field names in the study, with 13% in the English language, and 17% in Welsh. Most of the examples are the same descriptions as those entered on the land use section of the tithe survey, such as wood, meadow, pasture, and mountain. Therefore, these are generally functional descriptions of the land use. There are 29 examples where additional information tells us the land parcel is near another named feature or house, two describe location, and five refer to the size of the parcel.

Of the Welsh *'Physical Descriptor'*, or *PDW* examples, there are 356, of which 68% are the land type *gwaun* (which can mean high or low wet meadow, moorland, heath or meadow). The use of position or location near another feature or dwelling

is the most frequent qualifier at 30% of the total of the *gwaun* examples. A quarter of the qualifiers relate to the form of the land parcel, indicating size, shape etc. Only 2% of the qualifiers used relate to farming activities.

The next most frequent example is of the *coedcae* land type at 12%. The results indicate that over half of the entries (54%) have no qualifier, they are simplex names. The class of *ynys* is the third most frequent in the results of the *PDW* classification, with 6.5% of the total results, with position and form of the land parcel being the most frequent qualifier used. The classification of the remaining land types can be seen in table 1 below.

	CLUN	COED	COEDCAE	GWAUN	MORFA	MYNYDD	TON	YNYS
AGE	0	0	0	9	0	0	0	0
ASPECT	0	0	1	4	0	0	0	0
COLOUR	3	1	0	10	0	0	0	0
CULT	1	0	0	20	3	1	1	1
FARM	0	1	0	1	0	0	0	0
FARMARAB	0	0	0	2	0	0	0	0
FARMPAST	0	0	0	2	0	0	0	1
FLORA	0	1	1	19	0	0	0	3
FORM	0	1	9	67	1	1	2	4
GEOMORPH	0	4	2	10	0	0	0	1
LAND	0	1	1	18	0	0	0	0
NEAR-DWELLING	0	3	3	25	0	3	0	2
NEAR-FEATURE	0	2	0	26	0	1	0	1
NEAR-NAME	0	1	3	3	0	0	0	0
NO-ADJ	0	0	19	10	1	0	1	1
POSITION	0	5	5	23	2	4	1	9
TYPE	0	5	1	5	0	0	1	0

Table 1: Qualifiers in the Physical Descriptor Class

There are 27 *cultural* qualifiers of the *PD* classification in total, all of them appearing in the *PDW* class, the majority of which fall within the *gwaun* class.

‘Local & Other Descriptor’ Class

Of the ‘*Local and Other*’ descriptor class there are 558 entries, 26% of the study total entries. The ‘*Local and Other English*’ or *LODE* class accounts for 12%, so almost half of the entries. The most frequent qualifier in this classification is the

land class at 35% of the total qualifiers, which includes descriptions such as waste, slang and marsh.

Not far behind this figure was the '*Part of Larger*' class with 106 events. This is basically where there is a description in the field name which begins "part of..." and might be followed either by either an English or a Welsh name. Those that follow with a name, have either seen the name already categorised elsewhere, or the area they are part of is not a micro toponym as described in this study (a field name) so they will remain in the English classification and the first part of the name is counted only.

Of the '*Local and Other Descriptor Welsh*' (LODW) entries, the most frequent was the geomorphic qualifiers, with *Graig* (rock, likely figuratively in this case) the most popular. They account for almost a quarter (23%) of the qualifiers in this class. At 16%, the '*form*' qualifier was the next most frequent, dealing with size and shape, the most popular being '*erw*' (acre). There are 62 cultural qualifiers in the overall LOD classification, with 22 in the English totals, and 40 in the Welsh totals. A full list of the LOD qualifiers can be seen below in table 2.

	LODE	LODW
AGE	0	0
ASPECT	4	12

PART OF LARGER	106	2
POSITION	3	37
TYPE	120	31

Table 2: Full list of LOD qualifiers

Classification Stage Two

There are 2499 qualifiers recorded in this survey, which were divided between 18 classes. It is worth looking into more detail at the classes of qualifiers, to try and tease out some of the subtler trends which may be at play.

Age

The *age* class has 35 events and makes up just 1% of the total qualifiers in the study. The highest quantity, at 26 events, is found paired with the *UDW* class *cae* (field) in the form of *newydd* (new). There are seven pairs and one set of three in this group where they are located next to each other on the same farm. The parish of Glyncorrwg has the highest number of *cae newydd* names with 15 events. This increase in new fields is likely be contemporary with the period, due to the enclosures act, although landscape re-arrangement due to the upturn in mining activity in the area should not perhaps be discounted.

The remaining nine qualifiers are attached to the *gwaun PDW* class. In this group we have two interesting outliers, which perhaps fall outside the pattern. There is *henwaun* (old meadow) in the parish of Glyncorrwg, and *cae melin and hendy* (mill field and the old house) in the parish of Michaelstone Super Avan Lower.

Aspect

With 42 events, the *aspect* class is 2% of the overall qualifier total., with *cae* again attached to the most *aspect* qualifiers. Most of the events, at 33, are variants of *gywn* (Bright) and there are several others with a similar meaning, for example *boeth* (hot). There are only nine out of the 42 that display conditions other than fair and sunny, and they include *traws* (bad weather), *glaw* (rain) and *rhyn* (rough/exposed).

Colour

The *colour* class has 47 events, with 2% of the overall qualifier total. There are 25 *cae* qualifiers, most of which are variants of *glaes* (green). It seems likely that this is figurative speech meaning pasture or meadow. The next highest quantity of *colour* qualifiers we see is for *coch* (red/brown) with 12 events. This is mainly used as a

qualifier to *gwaun*, and the majority are found in the Glyncorrwg parish. Perhaps this is something that reflects the conditions in the locale.

Cultural/Social

The *cultural* qualifiers number 161 in events, which represents 6% of the total number. This class contains every qualifier which generally is not adjectival in nature. There are over 40 events where personal names are included in the micro toponym. Industry and resources are well represented, with 22 events with references to mining, quarrying, metalworking, and milling. But the most interesting group in this class are those which are conspicuous in the historic connotations their presence conjures when found in a place name.

Perhaps the most obvious in this group are those that contain the words *castell* (castle), *dinas* (fort), *llan* (old church enclosure or monastery), *tref* (town/homestead/dwelling place). But we also see references to elite leaders and battles (for example *cae swain* - noblemans field), as well as religious inferences, and folklore references.

Farm

There are three *farm* classifications in the study, general, pastoral and arable. Together they total 142 events, contributing 5% to the total number of qualifiers. Of the general farming qualifiers, there are 33 events where *scybor* (barn) is a part. In the arable group of qualifiers there are 25 events, referring mainly to ploughed land, although there are two mentions of *gwenith* (wheat). In the pastoral group, the majority reference cattle rearing, for example we see *cae lloi* (calves field/nursery) and *glowty* (cattle shed). The surprise in this group is that there are only five mentions of sheep out of the 142 events.

Flora and Fauna

The *flora and fauna* qualifiers are 6% of all the qualifiers, with 104 events. They are used mostly as a qualifier with *cae* (field), with almost half of the field names being of this construction. The highest number of examples are bracken and gorse (26

examples), reeds sedges and rushes (13 examples), birch (16 examples) and alder (15 examples). The surprise in this qualifier class is that there was only one mention of fauna which was wild boar

Form

The *form* class is where the qualifiers concerned with shape and size are assigned. They account for 12% of the total qualifiers, with 290 examples. Of these, over 50% of the total is accounted for by *bach* (small), and *mawr* (large). A further 50 events, or 17%, contain the qualifier *acre*. The remaining numbers are made up of various adjectives for shape, such as *hir* (long) and *main* (narrow). Of the 50 events that include *erw* (acre), only two are paired as qualifiers with *cae* (field).

Geomorphology

These qualifiers are those which refer to the geology of the locale within which the parcel of land sits. They account for 10% of the total number of qualifiers with 262 events. There are 83 entries which refer to hilly terrain, for example *tyle* (rough steep land). There are over 60 entries that relate to a sheltered valley environment, such as *cwm* (valley) and *pant* (hollow, dingle). They are paired with *cae* (field) in 107 events, which is 45% of the total *geomorphology* qualifiers. However, there are 104 events, 40% of the total, where they are not paired with either a *physical descriptor* or *unit descriptor*.

Land

The *land* qualifiers number 131 events, which is 5% of the total number of qualifiers for the study. As a qualifier in a field name, they infer something of the land conditions in the locale of the parcel of land in question. Of these events, 42 infer marshy, muddy land or land of poor quality, for example we see *tir garw* (rough land), and *waun garw* (rough gwaun). There are only six occurrences where the land quality is stated as being fair or better, as we find for example in *dryn tirion* (strong and tender).

Proximity

There are three qualifier types that cover 'proximity to', the first is the *near dwelling* qualifier type, those that indicate a homestead near the land parcel. The second type is *near feature*, for those that indicate a feature, either natural or manmade nearby. The third is the *near another* type, whereby a nearby landmark or place is named. There are 361 of these events, 14% of the total qualifiers in the study.

There are 172 events with *near dwelling* qualifiers, and of these 72 relate to the position of the field in relation to the house. For example, *cae dan y ty* (field below the house), and *cae uwch lawr ty* (field above/beyond the house). There are 37 of the 160 *near feature* events, which are similarly structures, for example *cae dan yr heol* (field below the road), and *coed dan yr heol* (wood below the road).

Part of Larger

These types of qualifier are straightforward, in that they indicate that the land parcel is part of a larger named entity. There are a 104 classified as of this type in the study, and a straightforward indication of shared access to a resource, for example 16 relate to mountain pasture, and 27 relate to a large area of meadow in Baglan parish, where at least 15 people or farms have claim to often more than one parcel of land.

Position

This class captures those qualifiers that seek to indicate the location of a parcel of land, by considering its position in relation to another of a similar kind. For example, there might be *gwaun ishaf* (lower meadow), *gwaun cenol* (middle meadow) and *gwaun uchaf* (higher or highest meadow) within the same farm, so it is how differentiation is made between them. They share qualifying duties with many of the *proximity* class. There are 304 examples and are the most used of the qualifiers after the combined *proximity* group. They are most commonly found as a qualifier with a *cae* (field) name type, which account for 46% of their total.

Type

The *type* qualifiers are also reasonably straightforward, in that they deal with the straight forward generalised landscape types that are found, and it is also the solution used where there are two nouns competing for primacy. For example, you might have *unit descriptor* such as *cae* (field), and a *physical descriptor* such as *gwaun* (meadow). As per the methodology set out earlier, the *unit descriptor* will always take primary, you can have a field of meadow, but you can't have a meadow of field. There are 188 events in this classification, and they are very broad in both where they are found and what type of landscape they describe.

There are several parcels where they are simply labelled with their basic function, or what they are, such as wood, field, *gwaun* (meadow). These were simply given a *no adjective* status for the second part of the classifying process. With 318 instances, they are greater in number than any of the genuine qualifier classes. Table 3 below gives a complete view of all the figures discussed in this section.

Number of assigned secondary classifications																	
	AGE	ASPECT	COLOUR	CULTURE	FARM	FARM_ARAB	FARM_PAST	FLORA_FAUNA	FORM	GEOMORPH	LAND	NEAR DWELLING	NEAR FEATURE	NEAR_NAME	NO_ADJECTIVE	PART_LARGER	POSITION

Table 3: Breakdown of assigned secondary classifications

Glyncorrwg (Blaengwrach) Parish Study

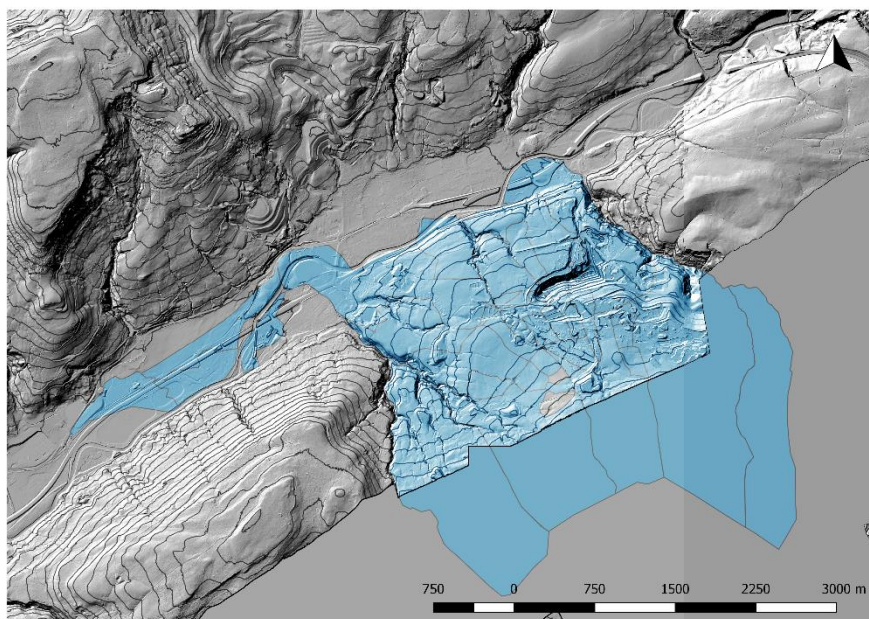

Figure 6: Digital Elevation Model of Blaengwrach, the parish extent highlighted in blue

The events from the Blaengwrach parish, the limits of which can be seen in figure 6 above, represent 13% of the total events in the survey, with 270 field names falling within the scope of the classification exercise. There are 16 farm units identified in the survey, with little in the way of piecemeal ownership.

Of the *UD* classification, there are 111 examples, with nine of them in the *UDE* class. Of these, seven are from the same farm. In the *UDW* classification, there are 102 events, of which 101 are in the *cae* class. In terms of the qualifiers for these, the most frequent with 18 events were those of which indicate the land parcel is near a feature of some sort, with ten related to water features, that is riverbanks, streams and springs.

Form was the second most frequent of the *cae* qualifiers, with 17 events, with 11 of these relating to size, for example *cae bach* (small field), and *cae mawr* (large

field). The one *UDW* entry which was not of the *cae* class was in fact a *croft* name (croft meaning small field).

In the *PD* class there are 105 events for this parish. There are 37 examples of the English (*PDE*) classifications, of which 29 are of a simplex form, simply describing the land usage, for example 'wood' or 'pasture'. The remaining 68 events are those of the *PDW* class, with 37 of these classed as *gwaun* (meadow). Of the sixteen farm units, ten of them have one or more *gwaun* field names. In terms of the qualifiers for the *gwaun* events, the most frequent are the *form* type, with 13 examples, mostly relating again to size. The next most frequent are six of those qualifiers which relate to position, for example containing elements such as *ychaf* (higher) and *cenol* (middle).

The next most frequent *PDW* class is where *coedcae* is the name element, the South Wales equivalent to *pridd* (the marginal land between the enclosed lower slopes, and the hilltops and mountain tops). With examples from seven farms, of the 14 examples of *coedcae* names, just over half of them are simplex forms.

The third most frequent example of the *PDW* class with seven events, has *ynys* (water meadow) as an element. Besides one outlier in Aberafan parish, this element is only found here in this study area, and in the Glyncorrwg and Clyne parishes. The qualifiers are three relating to position, two relating to the flora and fauna, and the remaining two describe a home meadow and a horse meadow.

There are 53 *LOD* events for Blaengwrach parish, 19 of which are classified *LODE*, and are of a mixed nature in terms of qualifier types, whilst the remaining 34 events are ascribed to the *LODW* class. The most frequent qualifiers found with the *LODW* classification are those which reflect the geomorphology of the environment in some way. Of the 12 classed as geomorphological, nine of them refer to the local hilly environment. A further nine qualifiers are of the category *form*, and they all relate to the size of the land parcel, in each case referring to *erw* (acre).

Table 4 below shows the all the qualifiers that have been ascribed to the cultural classification. As we can see, there are several events which reflect activities, such as mining. There are also a number which reflect personal ownership, which are probably historical, but there is little use for them without supported documentary evidence. The chapel in chapel field is a contemporary structure. An interesting entry is *cae castell* (castle field) which indicates some historic structure may have been present on the site in the past. It might also be that the *cae velin ishaf* (lower mill field) is also pointing towards some historical evidence.

Farm Name	Field Name	Translation	Use
Glyn eithinog	cae fforch y garen	fork of the crone Field	pasture
Nant yr Arthwaith	cae loval	mining field	pasture

Glyn eithinog	ynys prifsilla	home ynys	pasture

Table 4: list of cultural class qualifiers in Blaengwrach Parish

The results here tell us that the most common micro toponyms in this parish are those where the qualified is *cae* and the qualifiers tend to be adjectives which describe the field in terms of its form, shape, and size, and by its proximity to local natural feature, particularly streams and springs. It should also be noted that there are three examples where there is more than on field with the same name on the same farm. In terms of land types, *gwaun* is the most common in the parish, generally with a qualifier of size and shape.

There is one instance of the name *cae mawr* (large field) appearing twice, but in this case the map shows them as neighbouring fields, so they are probably simply considered as two parts of one larger parcel of land. There are two instances of *cae bach* (little field) appearing twice on a single farm, and in these cases the fields are not next to each other. This tells us that there was no requirement, at least in the eyes of this surveyor, that the land parcels did not need to be distinguishable simply by name only.

That *ynys* names are found mainly only here, Glyncorwng parish and Clyne Parish is not unusual if we consider geography. These parishes all sit where the valley floor is wider and are better positioned to have the correct conditions for river flooding to take place. As we can see of the Blaengwrach examples in figure 7 below, all of the *ynys* parcels are located at the riverside or streamside.

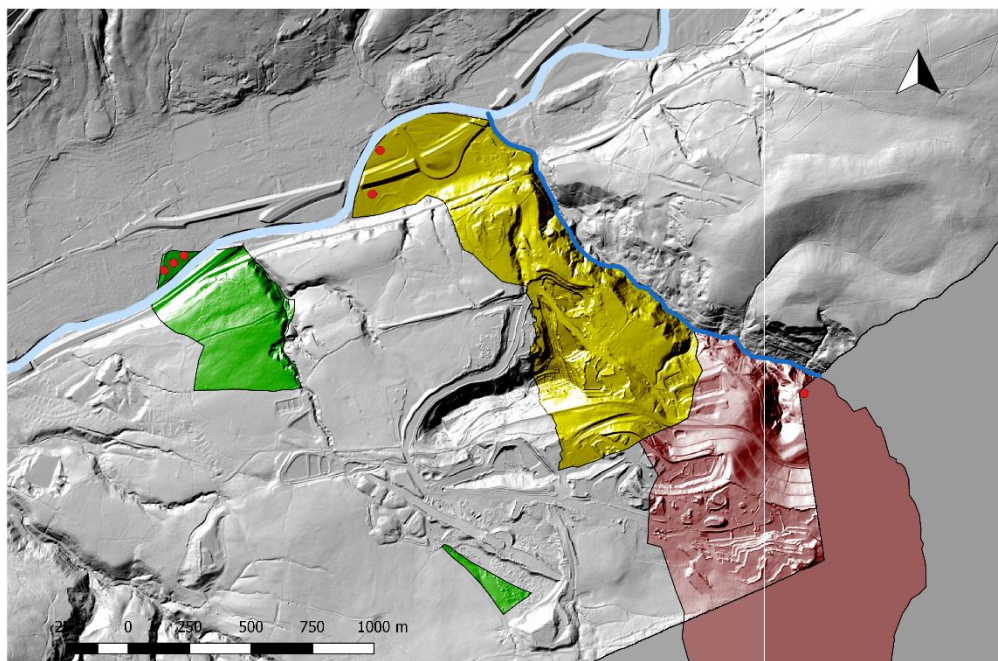

Figure 7: Location of the *ynys* micro toponyms, dotted in red.

The colours represent the extent of the farms the *ynys* fields belong to.

Glyncorrwg Parish Study

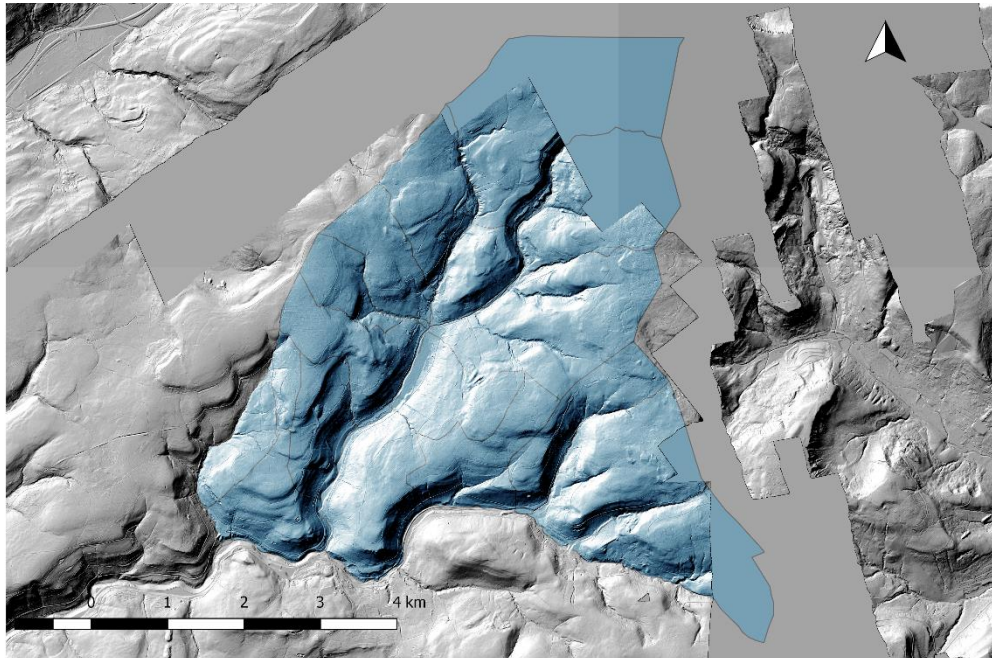

Figure 8: Digital Elevation Model of Glyncorrwg, the parish extent highlighted in blue

There are 304 events in total classified for the Glyncorrwg parish, constituting 15% of the total number of events in the project. Almost all land parcels fall within the boundaries of a named farm, with piecemeal ownership accounting for just six parcels of land, just 2% of the Glyncorrwg total. There are 17 named farms in the parish, the extent of which can be seen in figure 8.

There are 149 events of *UD* classifications in the parish overall, which is almost half of all the events. Only four of these are defined as *UDE*, just 3%. Of the remaining events which make up the *UDW* classification, 136 are of the type *cae* (field). The most frequent types of descriptor are those which refer to position of the land parcel itself, where adjectives such as in *uchaf* (higher/highest) are used. These account for 26% of all the *cae* descriptors. If we were to add to this number those qualifiers that indicate the position of the land parcel in relation to other features

and buildings, then this would account for over 56% of the *cae* *qualifiers*. The number of the *flora and fauna* qualifiers is notable, with 10 events which indicate species such as birch, alder, holly, gorse and fern.

There are 100 events in the *PDE and PDW* classifications, 15 of those being the English events, the majority of which (nine) are simply indicating the presence of mountain land. In the PDW category, again we find *gwaun* as the most frequent example with 46% of the share. Of the *gwaun* qualifiers, the most common are those associated with a house or farm name, with eight examples. There are a further six qualifiers which place the land parcel near a feature, five of which are associated with water. Something that stands out is the five qualifiers relating to colour, as all five refer to *gwaun goch* (red meadow). The next most frequent of the *PDW* class is *coedcae* which has 14 events (see figure 9 below), and *coed* (woods) and *mynydd* (mountain land) follow with eleven and eight events respectively.

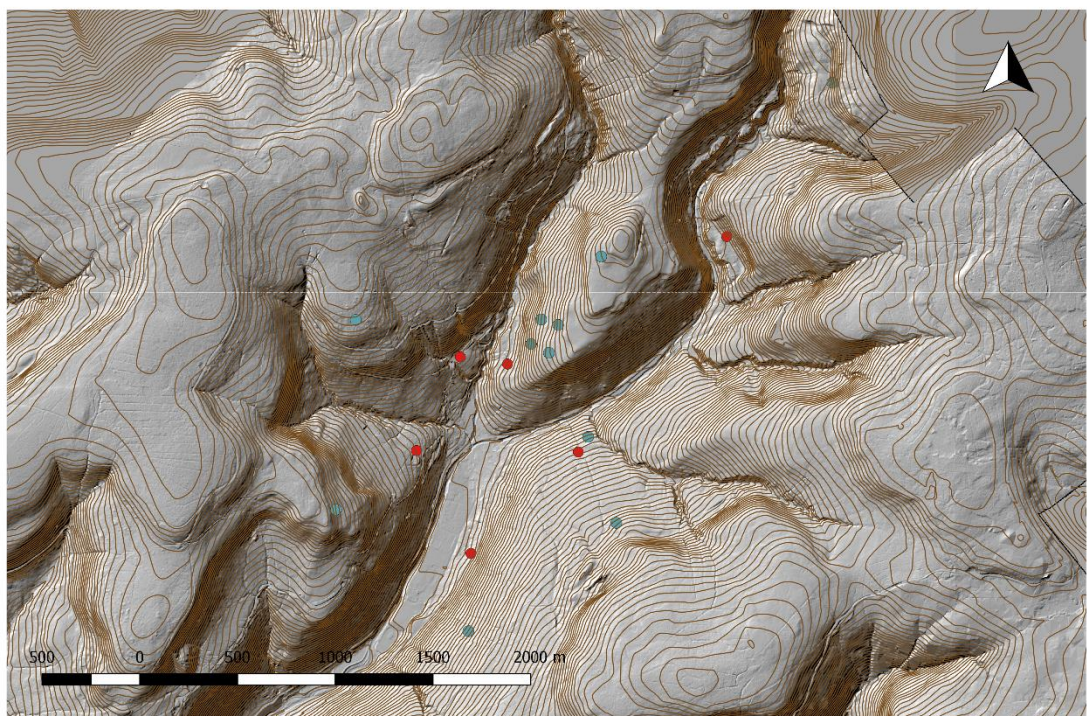

Figure 9: digital elevation model of the centre of glyncorwg parish showing 'coedcae' locations.

The red dots show the location of farmhouses, the blue dots are in the centre of areas called 'coedcae'. You can clearly see from the countours on the model how the 'coedcae' is on the fringe between the high mountain land and the lower sheltered slopes.

In terms of the *LOD* class, there are 18 English events, most of which are describing scraps of land which are waste ground, or where there are sheds and barns. Of the *LODW* class, the most frequently found qualifier is the *Geomorphology* category with 10 events, most of which are descriptive of the local hills.

Of the events in the *cultural* classification (see table 5 below), again most are related to activities and there are 2 with personal names attached. The most interesting is *cae'r ddintir* (*field of the fort/town land*) which suggests some historic activity.

Farm Name	Field Name	Translation	Use
Corrwg Fechan	cae'r ddintir	Field of the fort land	meadow
blaen corrwg	waun gronw and waun pen	"Gronw's" gwaun and gwaun at	pasture
	coed cae	the head of the coedcae	
Ilwyn ffynon	clwttyr dy isaf	Lower cloth house	pasture
Ilwyn ffynon	cae rys lea	Rhys Leia Field	meadow
Rhulech	cae ton y geveilia	ley field of the smithy	pasture
john bevan	gardd y clochdy	belfry garden	blank
john bevan	waun tyn eglwys	church gwaun	meadow
fforch laes	gardd y clochdy	belfry garden	arable
fforch laes	quarry and rubbish	quarry and rubbish	blank
fforch laes	cae quarrel	quarry field	pasture

Table 5: list of cultural class qualifiers in Glyncornwg parish

Discussion

The survey results clearly indicate that for this area of South Wales, the most likely field names that you will encounter in the nineteenth century tithe maps, are those which are very straight forward. It was shown both survey wide, and within the parish case studies, that the highest number of examples were names constructed with *cae* (field) as the qualified noun. The *cae* becomes qualified by its location in relation to important features, such as the farmhouse, the farm outbuildings, the roads in and out of the farm complex, but also to its location in difference to other parcels which are of a similar nature.

Very simple distinctions are also used between big and small of the same kind, for example the big meadow and the small meadow. But in some cases, these simple names are repeated in the same farm survey, and you might find two small meadows. Of course, what this points towards is that the names in the tithe map were put there with little purpose in mind, other than to label some measurements, and it simply reflects the surveying process of trying to differentiate one field from another as simply as possible. This is further supported by the simplex field names without any qualifiers, simply their function or general characteristic given such as wood, or meadow. That there were more of this type than in any other qualifier category says much about the source material.

Farming related names are present, although perhaps in less quantities than anticipated for a survey of a rural area. The majority of these again relate to those areas in the nucleus of the farm, such as the barn, and nursery fields for cattle. But very conspicuous in its absence is the mention of anything related to sheep-rearing, or indeed anything other than cattle.

When you move away from the fields around the farm nucleus however, and into the fringes of the upland pasture, *cae* names are no longer dominant, and geomorphological names come into play, especially reference to the hills and mountains that dominate the landscape.

Of those names relating to aspect, it is interesting to note that there were numerous names with references to those areas with a good sunny aspect, but few

examples of the opposite. And where the land conditions are mentioned, it is mostly areas of poor quality marsh land, and there is little mention of the good. Perhaps those areas of poor aspect have poor ground conditions as a result, and these are in fact the natural partners.

The small parish studies demonstrated local subtleties, that perhaps would not have been teased out had they had not received the focus. There was shown to be a tendency in Blaengwrach parish for land parcels names reflecting their proximity to the natural features that they were near, or more precisely watery features such as streams and pools. It highlights the importance of paying attention to local conditions, and of how local studies are important.

The examples given of the location of *ynys* field names in Blaengwrach, and *coedcae* names in Glyncorrwg were successful in demonstrating visually a known convention in place name studies, which generally are only ever conceptual.

Those classified together in the *cultural* group were always likely to show promise in terms of historic interest, and indeed there were several interesting field names which came through and suggested further research might be worthwhile. But whilst this is a small success for the study, it is due to the inherent nature of the type of name that they are, and not because of the methods put forward in this study.

With the first objective of this study being to identify any structures and rules of possible naming conventions found within the Tithe map data, then the only realistic assessment of how successful the study has been being the recognition that much more consideration and work would be needed.

The study has managed to tease out some interesting ideas around the differences between the homestead and the wider landscape. You have the practical field names based on their relationship to the farm infrastructure, and with others of the same type and purpose, with whom they are linked by location and position. You then leave the farm infrastructure behind when you leave the nucleus and move to the fringes and a more open landscape, where the environment plays a bigger role in the naming process.

In terms of the the source material, the names given in the Tithe survey, at least for those fields closer to the homestead it seems, were simply the most convenient labels that time. But, a better understanding of the role that the physical geography and environment plays in influencing the naming of a place is perhaps a useful route to go down, and maybe it is from the study of the fringe areas that we might see some progress.

The second objective was to identify any outliers which might be at odds with any conventional nineteenth century naming structures found, in the hope that they would point in the direction of earlier arrangements. But until the first objective is met, then the second will remain unfulfilled.

The aim of this study was to consider whether a synchronic approach to the study of field names could be successfully deployed, to identify clues or signposts that an archaeologist or historian might use as a route to further profitable historical enquiry. I would suggest that approach is the key word, and it could be successfully deployed, but rather than as a standalone method with the purpose of generating questions, it should perhaps be part of a more targeted and approach with specific and defined questions at the start.

Appendix One and Two: A list of frequent place name elements and their translation, as taken from the Welsh Classical Dictionary as per methods on page 12-18, followed by a full list of the place names used in the study.

GWAUN	<i>high and wet level ground, moorland, heath; low-lying marshy ground, meadow.</i>
COEDCAE	<i>transition between lowland and upland, boundary between enclosed and unenclosed = s wales equivalent to fridd</i>
BLAEN 1	<i>end, point, tip, apex, summit, also fig.; sharpness, keenness, fig.; front (of object).</i>
BLAEN 2	<i>source of river or stream, (pl. 'blaenau') upper reaches of river or stream, also</i>
BLAEN 3	<i>remotest region, march, limit, frontier, border; upland, highland; pass.</i>
CWM	<i>a deep narrow valley, coom, glen, dale; hollow, bowl-shaped depression; sometimes fig.</i>
FFYNNON	<i>spring, fountain, well; source, origin; issue; gland</i>
CLUN	<i>meadow, moor; brake, brushwood.</i>
DYFFRYN	<i>valley, vale, bottom, sometimes fig. of a low condition or sorry state</i>
TYLE	<i>steep (upward) road or path, (steep) gradient or slope, hill(ock); (dict.) land.</i>
[G]wern	<i>alder-tree(s) (the wood of which resists decay in water); made of alder. Also alder-grove, alder-marsh, swamp, quagmire; damp meadow; sometimes fig. hell.</i>
[g]lan	<i>river-bank, brink, edge; shore; slope, bank, hill-side, hillock, mountain.</i>
[L]lan	<i>(parish) church, ?monastery, transf. heaven; churchyard; enclosure, yard.</i>
LLWYN	<i>bush, shrub, brake, thicket; copse, grove, arbour; woods, forest; (esp. in love-poetry) the traditional rendezvous of lovers, symbol of love or romance</i>
MAES	<i>open country as opposed to woodland, expanse of open land, level land, plain; the country as opposed to the town, place away from the headquarters, office, laboratory, &c., where (practical) work is done or research material collected; territory belonging to a city; field, piece of land set aside for a particular purpose, usually enclosed by fences, hedges, &c.; field of (missionary, &c.) activity; tract of land with specified natural product or feature (e.g. coal, oil, snow); also fig.</i>
DARREN	<i>hillock, steep hill, scarp, rocky hill, rock, cliff, sand dune, piece of (poor or wild) land.</i>
LLWYD	<i>grey, faint (of colour, light, &c.); pale, pallid, wan; russet, brown; turbid, muddy (of water). Also not thriving</i>
BRYN	<i>hill, mount, rise, bank; heap, mound; prominence, highness.</i>
CEFN	<i>ridge; butt of ploughed land between two parallel furrows; opening furrows of such a butt; bibl. furlong; vertical fissure or fault in a rock.</i>
TWYN	<i>hill(ock), mound, knoll, hummock, heap; top (of hill, &c.), peak; dune; molehill; bush, hedge; also transf.</i>
TOR	<i>breast, slope, flank, or side (of mountain, hill, &c.); (river) bank.</i>
PEN	<i>top, summit, roof, highest point, also fig.; source (of stream, river, &c.), (river-)head; head (of bed, grave, table, &c.). Also extremity, end, beginning; headland, promontory, projecting point of rock; pole (of battery, &c.).</i>
GRAIG	<i>rock; boulder; stone, sometimes fig.</i>

OCHOR	<i>(part or area close to) edge, rim; slope, (hill or mountain) side, &c.; direction; (sometimes in pl.) region, area</i>
HIR	<i>long, tall, lengthy, extensive, far-reaching, long-lasting, prolix, dilatory, tedious</i>
GWYN	<i>white, greyish-white, pale; light, shining, bright; brilliant, white-hot; silver (usually of money); amber-coloured (of wine, as contrasted with red).</i>
