Virtual Reality Exhibit: Back in time.

This VR Exhibit would work well in the British Museum, placing each artifact into their historical location. When wearing the VR headset, the user would be transported back in time to a place in British history, interacting with artifacts of British heritage in their own context and making the user part of history. Visual feedback would be given by seeing the historical world around you. Audio feedback given by a relevant historical figure conversing with the user about the artifact. Helping the user to understand the role of each artifact in British heritage and the time period it comes from.

Rough Sketch:

The Oculus Quest headset is recommended as it's a standalone headset that doesn't require cables or a computer to use, allowing users to move unhindered. Additional hardware is not required aside from a charging cable. No software is required, however a museum curator will need to start the device through the app at the start of each day.
