Description

The Ground Effect Hydrofoil Submersible (GEHS) is a small vehicle that can transport people from one city to another at a high rate of speed. The occupants can travel from one underwater city to another at ease in comfort and style.

Therefore I have styled the interior of my craft to resemble private jets. I believe that these two concepts serve a similar purpose.

This craft will be autonomous, so will not need pilots. As a result I have a simple dashboard design at the front of the cabin. This would display the essential information about the ship, but also at the same time act as an entertainment control. That is the main display of the ship, but each passenger will have access to the same information and infotainment services on their own personal display. This is situated on a side table, flush with the side of the ship, next to their seat.

The table acts as storage for personal items such as laptops and mobiles etc. Drinks and food can be placed in special holders.

Passengers luggage is stored at the rear of the vessel behind the seats. I took inspiration from car netting that can be installed into the boot to hold items in place. This compartment gets smaller towards the rear so smaller items will have to be placed here while large suitcases will be at the front.

Not much lighting is needed as the window of the vessel is quite large. However when the vessel travels at night mood lighting is emitted from a strip in the roof as well as projecting down onto the tables and below the dashboard.
