

Participants, materials and procedural information: T-test study

30 participants; 11 male, 19 female.

Age range 18-60 $M = 27.53$, $SD = 10.44$

No participants were colour blind.

10 black and white pictures; 10 colour pictures

Pictures were presented to participants one at a time

PowerPoint was used to present pictures and pictures were shown for 2 seconds each

There were two sections; a black and white section and a colour section. At the end of each section participants were asked to remain silent for 30 seconds, and then write down as many of the pictures that they have just seen that they could remember

- Participants were provided with a consent form to read and sign if they agreed to take part
- The PowerPoint presentation was shown to participants individually within a lab setting
- The conditions of the study (black and white; colour) were counterbalanced so that half of the participants saw the black and white photos first, whilst the other half saw the colour photos first.
- Participants were asked to recall the pictures and write down the name of the object in the pictures (e.g., monkey).
- Following completion of both parts, participants were provided with a debrief form and thanked for their participation.
