Materials + Introduction to processing

Question 1 continued.

22nd Jan 2021

ACMA4000

The second material I'd like to discuss is plastic. Plastic is great for moulding and printing on, there's thousands of products that already use plastic material. If using plastic, it would be water tight without the need to add to it.

Food ~~used~~ that is packed in plastic is easy to open and lightweight.

Based on the comparison, I'd recommend a cardboard packing because of these points

- Biodegradable
- Cheap
- Recyclable
- Easily printable
- While it's not airtight - coating can be added
- Would be a popular choice to target market
- Light weight
- Very versatile for packing
- Very strong
- Low energy consumption

So when considering all aspects cardboard is my choice.
