

Essay

Introduction

In today's society, it's expected to be of use for some kind have strategies during any kind of work-related concept. Technology is a big part of today's world; students find a lot of different ways to study. This essay will provide the information explaining different types of strategies, in such ways as how and why students use them. These specific strategies help students understand common difficulties within technology.

Strategies

Students tend to learn quickly by getting introduced to how to learn instead of what they are learning about. This problem is quite frequent since students be prone to get under pressure since all they have in their mind is to make sure they get the assignment done before the deadline but what they don't do is that they don't learn the subject that they're specifically learning about which causes them to lose confidence in work overall. **Active thinking** is a method that allows students to engage and breaks their work into thinking, communicating, researching and making of what the subject is about. Many students believe that to begin their classes they should include some type of interaction to ensure the subject that they're learning about is understood (Promethean, 2021).

Another strategy is '**Eat the Frog**'; and this strategy is an alternative to pomodoro since it allows anyone to help you finish and get through their most challenging task first. This strategy allows you to make sure you get to finish your work while taking acceptable breaks throughout the task, making sure you have all the hardest tasks ahead of you while the easiest are to come which then allows you to go through this task with ease. You'll always need to accomplish difficult tasks to get closer to your goal, the more frogs you consume, the more progress will be achieved. (Sarah L, 2024).

Flash cards are a very common strategy which allows you to take in and remember small but valuable information. This way of learning will allow you to take an opportunity to use your muscle memory and allows you to have confidence within the subject. Creating a color-coded system is important because it makes sure that you get to take in the right information in the category. Flash cards develop studying through active recall, which can be one of the processes which our brain learns effectively (Tomas F, 2020).

One of the biggest problems that are common in failing or not completing assignments is confidence. Confidence allows you to have pride in your own work and knowledge. Building confidence is the main key for success, you can build confidence by interacting with people in a lot of ways like making sure you get involved more in **activities**.

Activities allow you to understand one person to another in different aspects, it also allows you to speak your mind without having to go overboard. You'll make your peers understand you and leave you to speak with ease. Regular quizzes and group activities will help that become a possibility.

Another strategy would be note taking. You can better comprehend and retain what you're learning when you take notes. Additionally, it might assist you in connecting concepts. Taking notes might assist you in avoiding distractions and concentrating on what matters. This means you can avoid inadvertent plagiarism, promote active learning, and build a strong external memory storage system. (Fiona G, 2023)
