The Task

Introduction

In this report I will discuss what kind of website I chose to make inline with the brief and show how it turned out including prototypes, then discuss the validity of my HTML and CSS, then evaluate how effective my website was at user consumption, within search engines, and its overall accessibility.

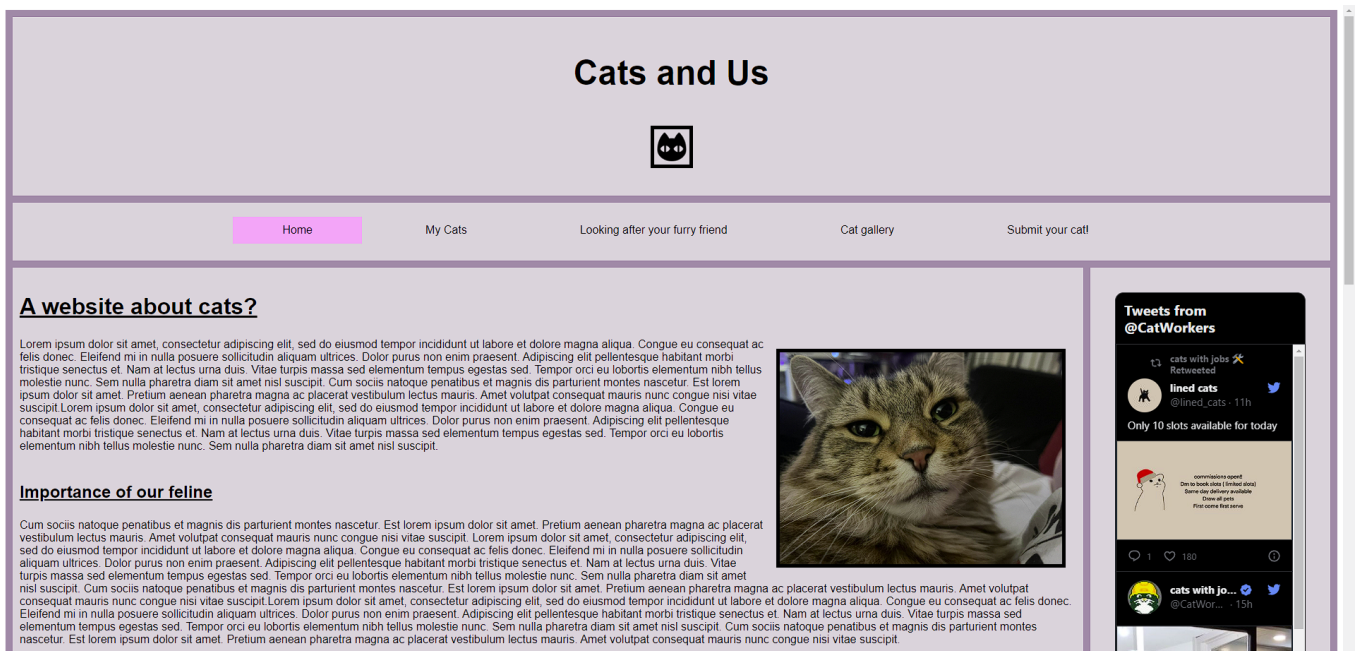

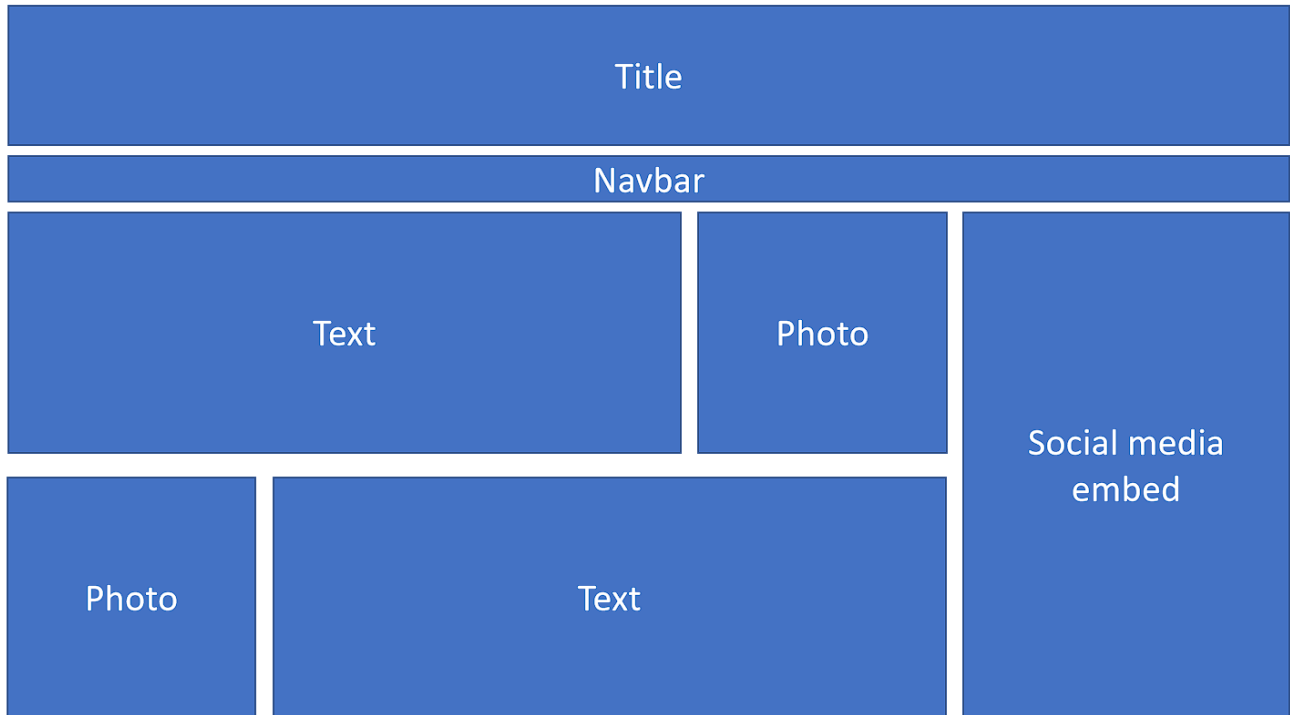

More information in appendices.

Requirements

I decided to design my website around one of my favourite things in this world, cats! All my friends know my passion for cats, and many have seen my room which has cat merchandise everywhere: statues, pins, plushies, towels and more, so I thought it would be fitting to base my website on this. The purpose of my website is to spread information about cats, I did this on the home page where I had titles such as “Cats and mental health” where there would be information on the effects of keeping a cat and how it impacts your mental health, as well as discussing if a dog might be a more suitable animal. I also had a page on looking after cats and tips on grooming them or generally keeping them safe. My site also has the intention of spreading the joy of cats with other like-minded people so I included a page about my two cats where there would be information about their impact on my life, and two other pages including a form for users to submit their cat photos, and a gallery page to show off those pictures. The target audience for my site is quite broad as cats effect people form every walk of life, the age range for my website could range from 13-100, and the people accessing it could be from varied backgrounds, jobs, classes, genders, and sexualities, but people who are interested in getting or sharing their cat is my target.

Implementation

Validation

HTML

To validate my HTML index page I used the link provided in the brief:

6. **Error** Bad value 50px for attribute height on element img: Expected a digit but saw p instead.
From line 36, column 11 to line 36, column 68
``
7. **Error** An img element must have an alt attribute, except under certain conditions. For details, consult [guidance on providing text alternatives for images](#).
From line 36, column 11 to line 36, column 68
``

The first error that was flagged was a bad value for defining my height and width for an image. Although it worked and my browser knew how to handle it, the correct syntax is for the height and width to be defined with CSS so I simply added in "style=" and put the height and width afterwards and the error cleared. I found the answer to this at:

<https://stackoverflow.com/questions/37159198/w3c-validation-error-with-image-width>

The second error I forgot to add alt text for an image as it was added relatively early so I added in an alt tag with an appropriate description.

10. **Error** Attribute ; not allowed on element div at this point.
From line 39, column 7 to line 43, column 7
`<div class="main" ; style="padding: 10px; text-align: left; color: #000000">`
Attributes for element div:
[Global attributes](#)

The third error was an incorrectly placed semi-colon, this caused no problems but was not correct syntax, removing it cleared the error.

20. **Error** The align attribute on the img element is obsolete. Use CSS instead.
From line 101, column 9 to line 107, column 10
``

This fourth error caused me many issues. The issue was that the "align" attribute should be written in CSS and not put directly into the HTML, the problem was that "align" didn't work when I put it into the CSS, so I had to find the CSS equivalent which ended up being the "float" attribute which took me a while to figure out because I kept putting it in the HTML instead of the CSS.

31. **Error** No p element in scope but a p end tag seen.
From line 222, column 9 to line 222, column 12
`</p>`

The last error was simply a loose p tag that I forgot to delete, so I deleted it.

Warnings:

1. **Warning** Consider adding a `lang` attribute to the `html` start tag to declare the language of this document.
[From line 1, column 16; to line 2, column 6](#)
 TYPE html>--<html>--< <he
 For further guidance, consult [Declaring the overall language of a page](#) and [Choosing language tags](#).
 If the HTML checker has misidentified the language of this document, please [file an issue report](#) or [send e-mail to report the problem](#).

The first warning the validator gave me was not including a “lang” attribute, so I added one in. “lang” is useful for defining the language of a web page, this tag is used by web readers to change pronunciation and accents so it is very important for accessibility.

34. **Warning** The `charset` attribute on the `script` element is obsolete.
[From line 233, column 9; to line 237, column 9](#)

```
>--<
<script--< async--< src="https://platform.twitter.com/widgets.js"--< charset="utf-8"--< >/scri
```

Another warning I had was having another “charset” attribute in the code. This came copied in with a website I embedded, although it wouldn’t cause any issues, I deleted it anyway.

13. **Info** Trailing slash on void elements [has no effect](#) and [interacts badly with unquoted attribute values](#).
[From line 186, column 17; to line 186, column 22](#)

```
<br /><br />--<
```

The last issue the validator picked up in my code was trailing slashes, this was under info and as shown above “has no effect” on the website. I wrote my HTML in visual studio code and used an extension called “prettier” that formatted my code every time I saved, and it added the trailing slash on the end of each element. If I was creating a larger website I would be more wary of trailing slashes but when making a small website it is unlikely to cause any issues but it is good to be aware of.

CSS

To validate my CSS stylesheet I used the link provided in the brief:

Congratulations! No Error Found.

This document validates as [CSS level 3 + SVG](#) !

As you can see there were no errors found in my CSS, this is unsurprising as I used very basic CSS and the formatting is very simple.

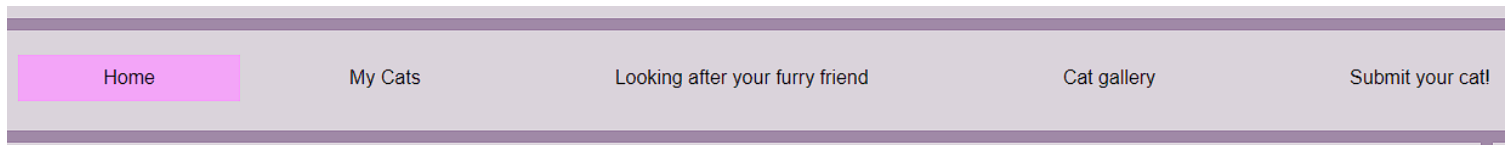

Evaluation

Usefulness

To evaluate the usefulness of my website I used a 2016 book by G. Sreedhar called “Design solutions for improving website quality and effectiveness” [1]. In the chapter “Identifying and Evaluating Web Metrics for Assuring the Quality of Web Designing” they use a system of 6 key characteristics to evaluate a website, these are **usability**, functionality, **reliability**, efficiency, maintainability and **portability**; I will only be using half of them as functionality, efficiency and maintainability as they describe them, are out of scope for our brief as they cover aspects of web development such as server uptime, security, download time and CPU usage.

Usability

Usability focuses on how easy it is to find the information you need from how the navigation is implemented to how easy it is to understand and operate the site; as our sites only needed to be five pages long it wasn’t difficult to implement an intuitive navigation bar, horizontal navigation bars are easy to use and because of the small page limit they could all fit there neatly and I didn’t need to create a dropdown menu, all of my page links have appropriate names and are self-explanatory for the user to find what they want with ease.

I also ensured that the more complicated parts of my site like the form were labelled and had validation so that you cannot accidentally submit the form incorrectly and that each page had some description of what was on it such as the gallery page which explained to the user what it was used for and how they can be a part of it.

 A form with a light purple background. It has three main sections:
 1. "Enter name of cat:" with a text input field containing the placeholder "Type here".
 2. "Enter your email:" with a text input field containing the placeholder "Type here".
 3. "Choose a photo:" with a file selection button labeled "Choose file" and a status label "No file chosen".
 At the bottom is a "Send!" button.

I ensured that my sites information could be digested easily by using appropriate headings and subheadings throughout to turn a big wall of text into chunks to make it more readable, and making bullet points on the page about looking after your cat so the user could read the key points of the video in an easy-to-read format.

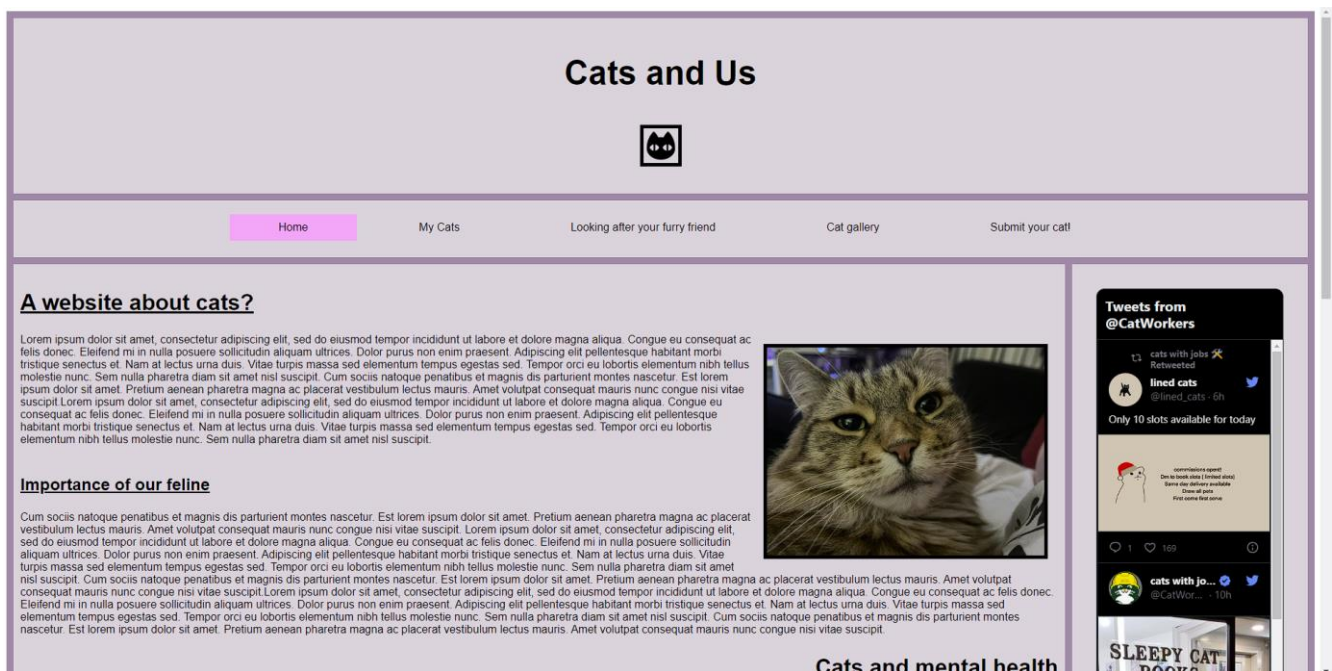

Reliability/ Portability

The reliability and portability section of the book covers a lot of out-of-scope topics but I'm going to focus on screen settings and browser support. Browser support is important for web development as your user could be using a variety of browsers so its important to not alienate some of your users by using code that isn't compatible on a majority of browsers. For that reason, when coding my website I made sure to use the most common tags and attributes that are guaranteed to be supported on the most used browsers, whenever I had to use a more obscure tag or attribute, I double checked W3 schools as they show the browser support of that tag or attribute as shown below [2].

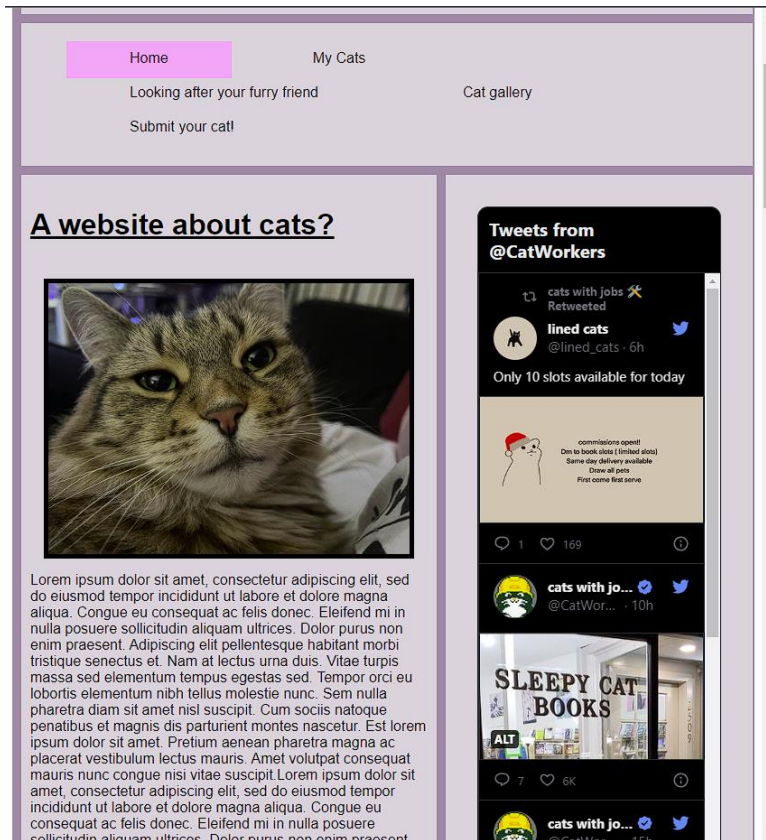

Browser Support

Element					
	Yes	Yes	Yes	Yes	Yes

Below is a screenshot of my website on Microsoft edge to show that my site is viewable and is presented as intended on a different browser:

Another aspect of reliability is screen size, like browser support it's also important to consider the users who are browsing on different devices, my website remains functional when the screen is resized but it does not retain the same style or look that was intended which isn't good as this would have a bad effect on mobile users, this could also affect users with different monitor sizes.

This is what the home page looks like re sized, as you can see all the content is still there and readable but the navigation bar has been pushed out of line and the cat picture should be smaller as the content is the priority in this instance. Therefore my future recommendation would be to use a percentage-based system that would automatically move, minimise, or maximise content depending on the size of the screen that the site is viewed on. This would make my site accessible to users with different monitor sizes and make it mobile friendly broadening the reach of the website.

Search Engine Optimisation

Search Engine Optimisation is the backbone of how websites are discovered, search engines like Google or Bing aim to push quality websites to page one of our searches when we search for anything, although these search engines cannot directly validate the content of a website it can check many different aspects of the site by crawling it and checking what kind of tags it uses and sites that link to it etc. SEO aims to push forward sites that at least present to be well structured and to be following good practices that search engines like Google set standards for, one of my biggest resources for this part of the report was Google themselves as their developers have written a starter guide introducing the topic to newcomers which is very useful considering the monopoly that Google has in the web space [3].

As stated above, tags are an important aspect of SEO because it gives an idea of how a site is structured, for example using “h” and “p” tags correctly show that your site has headings at different levels and using the “p” tag will show that you have content below those headings and that they are likely being used correctly, this hierarchy gives the web crawlers an idea of how your site presents information to its users. One example of how I used this in my website was on the index where I used the “h1” tag as the main header for the site then “h2” and “h3” as headings and subheadings to divide my content into chunks; using these in the correct order is important to the hierarchy [4].

```
<h2 style="text-align: left">A website about cats</h2>

<p>

  <br /><br />
</p>
<h3 style="text-align: left">Importance of our feline</h3>
```

Another important tag is the title of your pages, the google SEO starter guide notes to “Make sure each page on your site has unique text in the <title> element, which helps Google know how the page is distinct from the others on your site.”, this is an area I could’ve improved on my website as I did not create individual titles for each page, “Cats and Us” was the title I chose for my site, from my research I couldn’t find anything similar to this therefore I concluded that it would stand out well if it had the content to back it as it had a unique and descriptive title.

Another tag I should’ve taken more advantage of is the “meta name=description”, this can be used by the search engine to summarise your site and can offer more information to users who aren’t on the site yet so another improvement would be to add this to each page and give it a good description of the site and my topics.

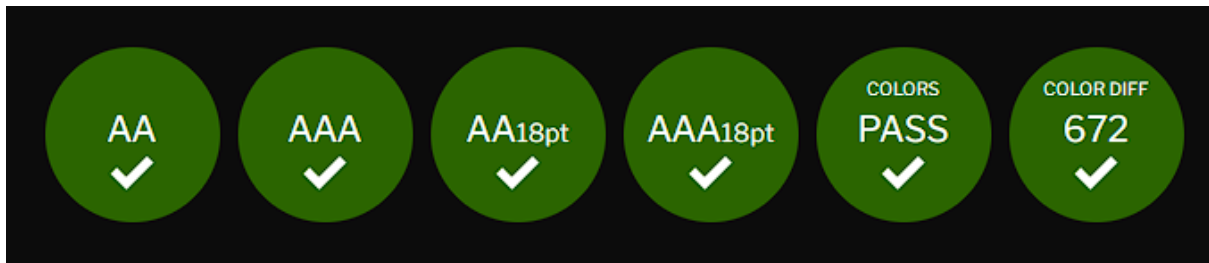

If my website was more complex, I would’ve also included aspects of SEO such as a robot.txt file and URL backlinking, a robot.txt is used to tell the web crawlers what sites they’re allowed to index which helps with optimisation, and URL backlinking ensures that no URL’s on your site link to anything that could be labelled as spam or detrimental to your site’s reputation, this also means that if a reputable site linked to yours then it may increase your sites reliability [5].

Accessibility

The four principles of accessibility are **perceivable**, **operable**, **understandable**, and **robust** [6]. The WCAG 2.1 [7] is the most up to date version as of the date on this report.

Perceivable

My website does well on perceivable as all my images have alt text that describes the image in enough detail, my site does not use any mp3 or mp4 files but if it did it would also have alt text to show what the video or audio shows. I also ensured to not use colours that blend such as red and pink as that could affect the readability of my content; my site also passed the contrast and luminosity checker as shown below:

The contrast ratio is: 12.68:1

Passed at Level AAA: The luminosity contrast ratio is very good for the chosen colours (#FDB0F3 and #000000).

Operable

My website also does well on being operable and would work well with users who only use keyboard or only use mice and on-screen keyboards, for example on my submission page the user can easily tab through the different form entries to type where they need to, and an onscreen would work to type into the form and choose a file. I also included a “back to top” button for long pages such as the gallery to make it more navigable. I also included a warning on the submission page to ensure that the user was over 13 years old to abide by the GDPR regulations for storing information on minors as I ask for their name and email which classes as their private information [8].

Understandable

Each of my pages has a “lang” tab in the HTML to ensure that the screen reader knows how to read out the content and my headings are easy to read and self-explanatory. The site also keeps the same theme throughout and is easy to navigate through the navigation bar as it is small and remains in the same place without the need for dropdown menus. The “label” tag used in the form also helps the screen reader to read through the form and ensure that they type in the correct text box, making it accessible to blind users. [9]. In the Looking after your cat page I also chose to put bullet points in to improve readability by summarising the points from the video in an easy-to-read format, this still makes the site useful if the embedded video is blocked in the users country or fails to load or is taken down, along with clear and consistent fonts which are easy to read and not a font like cursive or bold.

Robust

As the site for our brief was basic there weren't too many opportunities to add in extra features for multi browser support as the tags and elements that make up my website are universal as discussed in the “reliability/ portability” section.

Appendices

All photos used in my website belong to me or were given to me with permission to be used, except for the ones listed below, which can be found in the “/media” folder:

catIcon.ico [10]

catIcon.png [10]

On my index page I used a tool by twitter which can be found at <https://publish.twitter.com/#> to embed a live twitter feed.

I used a photo editing software called GIMP to edit “garethBurger.png”.

index.html:

```
